Thanks to the efforts of some people on the net I solved my memory problem and learned a little about memory on the 130xe. It turned out that one of the chips was fried, and it took some more specific tests to notice (read: swap some chips and look at the data returned from the errant locations). Even though the problems were all specific to a certain memory location, it was not an address line problem as was originally suspected.

And yes, I realize I goofed when I read 104 as 104 and not 10^4. I haven't gotten a replacement capacitor yet but the computer seems to be working fine anyways.

I'll finish off the upgrade tonight probably, soon as I finish my taxes (;-)).

Help!help!Help

I have some old Atari diskettes that are in Ascii format from the
ATARIWRITER and from ATARI Basic that I need translated into
Ascii IBM Dos format. Is there a program that now exists on the
IBM that will read the tracks off of the old Atari disks???

Thanks

Mark Witherspoon (mwithers)

From: darkwing@cis.umassd.edu
Message-ID: <1992Apr15.170120.1974@cis.umassd.edu>
Source record: 111576

Hello everyone....

A few things:

1. Percom model AT88-S1, sn 3237113D ...

This is single density.... correct ?

Will this unit take an IBM 360K drive (even if it only uses 1
head as single density) ?

Can this unit be converted to double density single sided ?
How about single density double sided ?

2. Anyone have an extra 6507 ?

3. Anyone have a good working 810 mechanism (or drive) with the
push button release ?

Also:

Anyone know if Mission Impossible by Epyx was released for the Atari ?

Thanks,

Message-ID: <1992Apr15.181454.12914@usenet.ins.cwru.edu>
Source record: 111577

I don't think your Percom will take an IBM 360K drive. It uses
bascially a half-height version of an 810 mechanism, which is
somewhat different from an IBM standard mech. It also runs at
288 rpm vs. 300 on the IBM mech. Yes, it IS a single-density
unit. I don't know about upgrading it to double, as it would take
something besides the mechanism to do it.

Call information for the number of San Jose Computers, as I believe
I saw them selling the old 810 MPI (pushbutton-eject) mechanisms
for around $10. I looked for the ad, but can't find it right now.

To my knowledge, Impossible Mission was never made for the 8-bit.
It's a shame, cause it was a good game on the Commodore 64.

1635. Yet another MIO question.....

Newsgroup: comp.sys.atari.8bit
Date: 1992-04-15 23:51:09 UTC
From: a644690c@edinboro.edu
Message-ID: <0095927E4EC29F80.2020333F@edinboro.edu>
Source record: 111580

Does anyone know what the maximum length of the DMA cable that runs between the MIO and Atari can be? I called ICD and they were not very helpful. (any surprise??). Well, the guy just said "Don't do it." when I asked how long the cable could be extended. I tried one that was about 8' long and I had NO luck, just a black screen and the red access LED never even flickered. I am sure that the cable could be at least a foot or two. 1.79 Mhz is not exactly going to bury even an 8' foot ribbon, but something is keeping it from working. I guess RF could pose a problem but I think I should have gotten something. Any help would be greatly appreciated.

Thanks,
-Adam Conover.
a644690c@edinboro.edu.

PS. I mentioned not receiving any mail a while back. It WAS the mailer I guess. I got a flood of messages the other day.

1643. MIO Question

Newsgroup: comp.sys.atari.8bit
Date: 1992-04-17 01:28:17 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9204170128.AA01564@smithkline.com>
Source record: 111587

I see Adam Conver has fallen into the same quagmire as me RE: trying to put some distance between the computer & HD host adapter. Yup, I got that problem too. I only need 3 feet of cable between my XL & HD host, no can do. This isn't just an MIO problem, either. The CSS Black Box suffers the same affliction. Just a few days ago I had a nice chat w/Bob Puff about it. He said it was probably this or that or the other, take your choice: crosstalk, distributed capacitance, excess resistance, too much inductive reactance. Well, OK, fine, I know about all those things, but which one is the *major* contributor to the problem? Bob didn't know, no one has ever studied it. It will require an empirical study, I doubt anything beyond basic RF theory will help much. Someone making up different lengths of cable, booting up the system, & recording waveform shapes on a scope. The critical length seem sto be about 10 inches.

I'm not sure Adam's speculation about getting away with a relatively low freq. like 1.79MHz on parallel cable is correct. Bob & I went a few rounds on that. Bob thinks you need a minimum of 5 harmonics to maintain a decent square wave. That means the cable should have a 20MHz bandwidth. Those crummy ribbon cables can't hack it. OK, why not throw in some Schmidt trigger gates to spruce up the squarewaves? Whoops, buffer gates slow down the signals a smidge, next thing you know the timing sequences are out of sync, computer's brain gets tied in knots, etc.

My alter ego, the 8-Bit Alchemist, has a gut hunch the answer- if indeed there is one- lies in lo-capacitance/lo inductance/lo resistance shielded cable. The shield should be grounded on one side only, probably the computer side. Twisted pair cable offers possibilites, too- as long as ground loops don't introduce new horrors. The Alchemist's theory on that is to use an odd # of GND connections. That Alchemist guy even stole money from my wallet & bought a bunch of different shielded/lo-cap cables, all now collecting dust.

Excuse me while I exchange personalites here.....

Ah. All this 8bit magazine/Campaign stuff has drained away my hardware hacking resources, dunno when I'll ever get to play w/all that stuff The Alchemist bought.

A few months ago I posed the very same question to the Digest myself. Andrew Heller answered, said he knew someone who solved the problem & put several feet of cable successfully between PBI & host adapter. Promised to come back w/some specifics but never did. Claimed the main culprit was distributed capacitance but failed to elaborate.

So, Andrew ole' buddy, are yah reading this?

- BEN POEHLAND
The Alchemist

PS- Thanks for the thanks, Bill. Campaign results are looking optimistic!

1645. question concerning ftp stuff

Newsgroup: comp.sys.atari.8bit
Date: 1992-04-18 20:21:40 UTC
From: jsd@seawolf.owlnet.rice.edu
Message-ID: <1992Apr18.202140.6571@rice.edu>
Source record: 111590

I've gotten a couple programs via ftp but can't get them working.
The problem is that I get an error 136 (End-of-file reached)
when trying to binary load them.

One of the programs was the supunarc.com program for unARCing
programs. Another was a game in a arc format that I unARCed
on SunSparc and then transferred to my Atari.

If its of any use, I'm using DOS 2.0S on an Atari800 with and 810.

Any help or suggestions would be most appreciated!

Now THIS is on HELLUVA joystick! I bought it slightly used off of my friend for $8... Very nice little controller. The firebutton is a little less responsive than the peaice of ---- (supposedly analog, so said the people who sold it to me) joystick I got (this was from MCM..) It wasn't even hard to get used to after using that MCM one which needed you (actually, allowed you) to bend it far (about 1/4-1/2", I believe). This one only LETS you move it about 1-2mm... Nice, arcadish joystick. It's from SunCom. The retail price on the side of the box was $10.99. It's DEFINITELY worth it. Very sturd, and quite a bit more metal than in most joysticks.

There... there's my joystick review of the year!
aaaa!

Hello all, fellow Atarians!

I've still wished that the AR series would have continued into the Wilderness, the Castle, and the Arena. Very few games created such an atmosphere with environmental sounds and wonderful themes to the extent that AR did, making it a pioneering work.

In any case, I explored 90% of the City and about 50% of the Dungeon. Does anybody out there have a complete solution/hints/tricks/etc. or other information on either the City or the Dungeon? I just saw the two posts on AR City character name cheats, but there must be more out there! Thanks!

Source record: 111602

The keys are CHERRY (brand name) keys, but there are many types, you would have to take the sticky key with you to a GOOD electronics place (not Radio Shack) to get a replacement. Otherwise, the CAPs pull off, so you can take a small pliers and bend a internal tab. This is easyer said then done. Make sure the power is off and you are grounded. (accually power may be on, but you need to be careful. there isn'T enough power to kill you, but the computer is different.

A rare case would be a cracked circuit board, inwhice case you would have to fix that, but intermitent problems proboly wouldn'T amount to that.

I used to play a lot of AR, but I'm in recovery<grin>. I was active on CI$ when the games were new so I picked a few files off there. Thanks Tim & Dave, if you're lurking I'll get your maps out via snail mail today. There were at least two character editors for The Dungeon & I seem to recall one for The City. I think the ARC file for The City discussion was about 160k. The hints were not all that great, but they did get you across the river: [2 coppers @ midnight]. No one ever complained about the hints, but a number of people said editing their characters to 255 for stats & 1,000,000 HP took a lot of the fun out. Really, if you have an exceptionally 'GOOD' level 6 or 7 character from The City you don't have to even use the editors. Have you found [The Weapon Enchantriss, Lucky's Potient Brewery] ?

Source record: 111511

Hi,

I would like to thank the people who commented about my MIO cable length problem. (I guess the older discussion that was mentioned happened before I arrived on the net.) I was not considering the ribbon acting as a capacitor, I guess it would. Anyway, I was not really thinking when I made the comment about the ribbon cable and 1.79Mhz. I guess the problem really lies in the pulse edges since most gates are edge triggered. It does not really matter what the rate is, the pulse edges are going to represent the same change in amplitude, but when harmonics come into play, I really could not tell you what is happening.

I am still having a problem though....
I tried building myself another 50pin card to 50pin pin-edge connector w/ about 5" of cable and I STILL had no luck. I know the MIO is fine, because the original cable works. At this point I would be happy with just more flexible cable and sturdier ends, which I need due to a cramped work space. (My original intent was to get the thing away from my monitor/TV and disk drives because the RF is so great.) What I am wondering is this: Why don't the cables I build work, but the beat-up old one does? (I do, by the way, know how to build cables properly :-). I noticed that the Red strip (pin one) on the ribbon is on the LEFT going into the MIO, but pin one on the board (according to the numbers on the board) is on the RIGHT. What is going on there??

Also: has anyone come up with any good idea on how to cut down on some of the RF interference produced by the MIO?

Thanks,
-Adam Conover.
a644690c@edinboro.edu.

PS. Could capacitance be a problem over only a few inches with the right (wrong) ribbon?

1667. 8-bit accessories wanted

Ok, Andrew, I coulda *swore* it was you who posted something about these PBI cables. About the capacitance. Last Nov. or so, I think.

So, if it wasn't Andrew Heller, then who WAS it? Anybody?

I only have about a foot of email printouts here at work , but those only go back to Jan. I have a few more feet at home, I'll look there tonite....

I never heard of either a BB or MIO being supplied w/18" cable. Mine came w/ like 6" cable. I also have some of that shielded copper screened ribbon stuff, dunno if that will work. I was sorta hoping we'd hear from someone who'd already solved this problem, it would save The Alchemist a lot of time/sweat.

Sweat, I don't mind. But TIME is at a premium.....

=>Hey... niether of these are readily 8-but usable, are they??

Yes, if you have an ATARI-850 or an R-VERTER (Advanced Interface Devices)
that allows an RS-232 device to be connected to an Atari.

With either of these (or similar) devices you should be able to connect
a modem or serial printer to an Atari 400/800/800XL CPU.

I'm no expert, but San Jose Computers sells reconditioned 1200xl for $49, a good 800xl may be about equal to a little more valuble. I've seen 'em go form $30-$80. Drives seem to go for anywhere from $30 to $120 depending on if it's a Happy modified drive or an odd ball that you can't find parts for: like a Rana for instance <grin>. The type of printer means everything. If it's an Atari only then it's only worth $20 to $50, if it's something like a Citizen 120D or Panasonic 1091 then it's probably worth about $100.

I know a bad source for maps, me! Last ones I sent out took me two months
before I copied & sent them. Maybe one of those guys will forward you a copy.
They can't be any slower then me.
BTW: Way back when Software Toolworks was still in business (right Co.?)
after they took over the AR series someone asked them if it was OK for
me to copy the maps, at the time I'd refused because of copyright, &
they gave the go ahead. I've also talked with Supra Corp about their old
Microport XL schematics & got the approval to send out a copy to someone,
but I forgot who asked! If you're lurking out there, let me know.

From: rwt@swamp.cis.ufl.edu
Message-ID: <35251@uflorida.cis.ufl.edu>
Source record: 111526

Greetings,
Anyone have any ideas what this problem may be?
I have a 130XE expanded to 320k, the extended memory will work
fine for about a week, and then start to fail. Ramdisks will suddenly
erase, Paperclip XE will lock up. After about another week, it will
work fine again! The wires all seem to be ok. Could it be the
74ls158? Would it be worth replacing to find out? Thanks in
advance for any help.

Bear in mind that this is all just speculation...

In article <etxansk.704029756@garbod20> etxansk@garbo.ericsson.se writes:
>
> (a) why the bars look so stable, no flicker in their left-right edges?

The wait for horizontal sync keeps the timing constant for each
iteration of the loop, I would suspect.

> (b) why the first few bars are wider?

I'm not sure. Something to keep in mind is that after accessing
WSYNC, you have a few cycles of horizontal retrace time before the
next line starts to be displayed.

Sorry if this is vague...

This is a lame response...but make your own. My brother and I spent hours mapping the City...and it was a blast! There's this one part *REAL* close to Town Center Square that is IMPOSSIBLE to figure out without a map!!!

If anyone knows what I'm talking about there's some cool Wizard Star something or other at the center of "The Maze"...it is totally way ultra spiffy cool. I strongly recommend you take the time to map it yourself!!!!

1684. MIO Cables

Ok, for sure it wasn't Andrew Heller who claimed he knew someone who'd solved the host adapter cable length problem.

It was Amos Jackson! (Dadhangit, I *knew* it was a name that began with "A"!) I only had to hunt thru 2 feet of email printouts to find this. It was in the IA8 Digest dated Dec. 5, 1991. Alchemist hasn't lost his marbles after all! (well, not all of them anyway).

So Amos, you still on this Net? Speak up good buddy, there's peoples here who wanna hear how your friend got a long cable to work!

Jeff McWilliams' comments about how a squarewave gets turned into a cruddy sinewave as a function of increased capacitance (which in turn is a function of cable length) is all well & good, but do we know for sure this is the cause of the com failure with long PBI cables? I think not, there are so many other variables. It's certainly a likely culprit, I wouldn't rule it out, but the problem is no one knows for sure 'cause nobody ever undertook a systematic examination of the system.

Which is why the Amos Jackson's comments last Dec. were so intriguing. Did his friend make up a long cable that worked OK by happenstance, or does Amos's friend know something the rest of us would also like to know?

C'mon, Amos, we're dyin' here!

Oh yah, this is for Bill Kendrick- no, you aren't being a geek, my last comments were indeed directed to you. The Campaign is in a mopping-up phase, late responses still dribbling in, etc. Looks like we might issue some kind of final report around May 1. I don't yet see any cause to deter me from my previous optimism (tee-hee!), but we'll have to ask everyone to please be patient, fine wine takes time & all that.

- BEN POEHLAND

Ok, good..whew! Was worring about what else I might have said...
So has anybody bothered to BOTHER the guys and ICD about this? Hmmm
might not lend us much help...I can see the reply now: "um, 4 inches didn't
work so we left it at 3 and let it be! 8-)"

And about the Atari Classics Campaign...have any of you read the AtariUser
magazine? We can atleast top that! Its a "nice" magazine...looks odd..feels
odd with all that recycled paper. hmmm here is to high hopes....and (kneeling
down praying) a first issue of many into the 21st century!

Andrew

I had the same problems once, except I was upgrading my 800 to 288K.
You need to run a memory checker, one that is specific to your upgrade
that way it not only can tell you the bad memory location(s), but will
also tell you wwhich chip to replace.
Hope this helps,
Jonathan

Wow! The recent Alternate Reality posts have got me interested in this game again. By far, it's my favorite game on the 8-bit, but I haven't touched it in over a year because I thought I'd discovered everything in the City and Dungeon. I guess not... I never knew about the "fiat" secret and the other commands (hey, I named my character Master of Chronos back when I first got the City back in '85 or so, after going through the disks with a sector editor and seeing that text imbedded at the end of side 1!).

So...does anybody else know of any other hidden goodies in the City or Dungeon that I might have missed?

A couple specific questions that I've always wondered about:

1) "The City of Xebec's Demise". Who is/was Xebec?????

2) What is the Gargoyle's name in the Dungeon?

A Xebec is a type of ship/boat. I once had the Garg's name, it's sort'a nonsensical. All it does is get you a pulse rifle I think. IF they had continued the series you also would have been able to get a radiation suit in that hallwall just outside Omar's that has a blink mine that keeps throwing you one square back when you step into it.

The Microport was just a 6821 with the necessary decoding to map it into any page between $D100 & $D700. Plugged into the XL expansion bus & had about 4"X6" prototyping/wire wrap area for "experimenting". It 'was' as in no longer available, a great learning tool for adding memory mapped I/O. I'm thinking really seriously of adding a a couple of 6551 to the bus, something I wouldn't of been able to figure out without the instructions in the Microport. Concurent I/O makes me nausous, I want a R: device on the BUS! <g>. I can't send schematics via E-Mail, they're not files.

I have been out of the 8-bit Atari world for a few years now,
and would like to get some feel for what's hot and what's not,
softwarewise, out here today.

What is/are your favorite:

1) DOS

2) programming language

3) text editor/word processor

4) communication program

5) spreadsheet

6) database

7) typing tutor

8) user interface

9) drawing/paint package

Please include sources.

What are the hottest hardware enhancements these days? (please give sources)

I know that I am asking a lot, and will appreciate any responses.

Keith

Message-ID: <1992Apr24.164156.20492@usenet.ins.cwru.edu>
Source record: 111540

Okay, here are my favorites:

DOS: SpartaDOS 3.2 or MYDOS 4.5, depending on what I'm doing.

Language: Action! or Basic XE

Text Editor: Action!

Word Processor: AtariWriter Plus (Actually, I use Word Perfect
on my Mega STE)

Communications Program: BobTerm 1.21

Spreadsheet: Yeah right.

Typing Tutor: Atari's own Touch Typing is still
my favorite.

User Interface: Huh?

Drawing/Paint Package: None. I use Degas or Prism Paint on my MSTE.

I still use the 8-bit quite a bit, but when you have a machine that's
far more capable in certain areas, I use it instead.

>
>_____HH
>PhBill: Bill Kendrick
>moon!cyberden!phbill@well.sf.ca.us
>_____JJ!

Yeah, I've heard of Primus! (just ask my down-stairs neighbors :-)
Primus definitely takes a 'special taste' in music.....

At the risk of starting a non-Atari related thread; I am curious as to
what types of music other Atari 8-bitters like. I really enjoy psychology
and this could be an interesting survey. I have a feeling that most people
that really enjoy computers also really enjoy music. Both are alternative
forms of communication. I believe, very strongly, that the types of music
people listen to has much to do with their other interests and I think
that users of different computers probably have different musical tastes.

Here are some of my favorites:
R.E.M.
RUSH
Grateful Dead
Phish
Blues Traveler
Primus
(A lot of classic rock: Cream, Steve Miller, any Eric Calpton, etc.)
(even SOME Techno/industrial stuff)

Is anyone interested in (me?) getting a survey together? Is it worth it?
Think about it......

Peace,
-Adam Conover.

krw@cbnewsk.cb.att.com (keith.r.smith) writes:

>
1) DOS
Definitely MyDOS.. it's VERY compatible with Atari's 2.5, but also adds
subdirectories and all sorts of spiffy things. It's run off a menu, just
like 2.5. It's PD (shareware?) and avaliable ...well..somewhere!?
>
> 2) programming language
For BASIC's, it's gotta be TurboBASIC XL. I'd LOVE to learn (and get!)
'C', but haven't gotten to it yet. It's supposed to be the "fad" of
languages, and supposedly get you any computer job.. (hmm!?) Also,
Action! (from OSS..then ICD, when OSS died... now I think ICD doesn't
support it anymore) looks "to-die-for!".. I have yet to GET it as
well. It's structured and is said to have a SUPERB editor.
(BTW: it's NOT PD and is on cartridge)
>
> 3) text editor/word processor
I have TextPro 4.56 (some 130xe version). I use it alot to edit my Oasis
Jr.BBS files, but it isn't the most powerful. I really recommend
AtariWriter +, even tho it LOVES to add all that JUNK to the beginning,
and handles ONLY 2 drives an DOS 2.5 (you can load it from MyDOS and
Sparta, but you still can't use the directory commands, etc.etc.) (there
is a Sparta patch, tho...not sure about one for MyDOS.)
(this is also pd/share..? the FINAL version (is that done??) MIGHT be
(c)'d. BTW: Textpro SEEMS to be just a very upgraded (and far easier to
use) version of Compute!'s SpeedScript.)
>
> 4) communication program
DEFINITELY BobTerm. I have version 1.21, and I BELIEVE there is a 1.22
out there somewhere, or am I mistaken. It's the BEST terminal program
>I<'ve ever used on ANY computer (then again, I don't get out THAT much!
:)). Very powerful. But, if you're into Kermit stuff, I've heard (I
have it as well, but never DID figure it out) that Kermit 65 is very
good. So.. I guess it depends on what you want to do. Both of these are
PD (or Shareware.. I think BT is Shareware.)
>
> 5) spreadsheet
>
> 6) database
>
> 7) typing tutor
Don't have any of these types of programs..^
>

> 8) user interface
How do you mean?? If you mean an "environment", then THAT will depend on what you want. I have a demo. of GOE, which will (is this out? I was gonna ask that today anyways..) be a cartridge much like the RTime/8 and SpartaDOS X ones (ie, can have another cart. sit on top of it). It's a Mac/Xerox/Windows/GOES type of environment. THere is also Diamond, which too is a cartridge, but that's about all I know about that!
If you meant something like keyboard/joystick/touchtablet,etc. I believe that joystick (or the trackball, which can act like either a joystick or trackball) and a keyboard is about all you need. (sorta like how the light-gun/light-pen/paddles died...) Or a mouse that can possibly act like both a mouse and joystick. It depends on what you need.
ORRR.... if you meant an actual INTERFACE, all I can say is, if you have $200, GET THE BLACK BOX!!!!!!! ... or an 850 or P:R:Connection will do for just P:rinter/R:S232 (usually modem) interface. (whew...)
>
> 9) drawing/paint package
Well... from what I've heard/seen a little of, it seems that RAMBrandt is the best. I belIEVE it was produced by Antic??? StarFleet software also has a version that supports Atari Xmm801 printer dumps, and he has been trying to get the program released into the PD.. but I don't believe it is yet. I'm also not sure where you CAN get it, except maybe B&C computervisions.
Also, I've talked to Steve Hoffee of K.O.Products and he REALLY recommends EscalPaint which is from Germany (I think). It supports full 256 color graphics. The problem is, it canNOT zoom or cut/paste, and it seems that a program like that, esp. with a joystick (I believe it actually can handle pretty much any controller, tho.) would be VERY hard to start from scratch in. It uses Prizm/APAC ILC format pictures, and also seems to have a few bytes of code at the end which lets the picture use 256 colors OUT OF A PALLETTE of about 25,>000<. (some pictures have adjusted hues/tones/etc.) (I got the MAPDA Amiga Picture Show demo. from Steve. Very nice! :))

ANYways... I hope I helped a little bit. I seem to like what the rest of you people like, so.. Then again, my opinions ARE a bit TwIsTeD!, so... don't use me as the ONLY source of opinions! :)
bye!

I played with my "GOE" demo a little bit today. Has the "final product"
ever been released?? (this was from "total control software" and David
R. Sullivan (I believe)).

So?? Is it OUT yet!? :) And how much does it cost!?
I've heard SO SO >little!< about it!

Atari 8-bit Items for sale

Well, its time to see if I can find a good home for my 8bit Atari
items that are no longer being used. I have packaged everything
listed below into one big box and would like to sell it all together
if possible. I am not looking to get a lot of $$ for it but I need to
cover shipping costs. Let me know if you are interested. I will not
be available to reply between May 1 and May 20, so if I don't get back
to you, that is the reason.

All software on original disks with documentation unless otherwise stated.

SOFTWARE
Disk Game Package
1- Loadrunners Rescue
2- Cosmic Balance
3- Cosmic Balance 2
4- F-15 Strike Eagle
5- Autoduel
6- War Game Construction Set
7- Objective Kursk
8- Kampfgruppe
9- 50 Mission Crush
10- Conflict in Viet Nam
11- Flight Simulator 2
12- Field of Fire
13- Tail of Beta Lyrae
14- Rescue on Fractalus
15- Dimension X
16- Pirates of the Barbary Coast
17- Eldolon
18- Silence Service
19- Ali Baba & the 40 Thieves
20- Galahad & the Holy Grail
21- Hitchhikers Guide to the Galaxy
22- Bolderdash Construction Set
23- Scott Adam's Saga 3
24- Decision in the Desert (no docs.)
25- Seven Cities of Gold (no docs, not org. disk)
26- (3) Lotsa Bytes Game Disks (No Docs)

Bank Street Music Writer + Advanced Music Player
PrintShop + PrintShop Companion + 5 Icon Disks + Typesetter + Awardware
Synfile + (Can use Mosaic extended memory)
Syncalc (Can use Mosaic extended memory)

News Room with all clipart
MMG and DataSoft Basic Compilers (2 different compilers)
Superboots Paint
Koalaware + Koalapad + Koalapainter Cart + Atari Video Easel

Language + Utility Pack
Holiday Software Handyman
Atari Home Filing Manager
Basic View 1.2
Basic /XA
(7) LotsaBytes Utility Disks (No paper docs.)
DOS 2.5
PILOT Cart. + Manuals
LOGO Cart. + Manuals
ASSEM/EDITOR Cart. + Manuals
AMODEM 752 (Download)(Formatted for SDX)
TurboBASIC (Download)(Formatted for SDX)
APX PASCAL (No Docs.)

Atariwriter Cart + Printer Driver Maker + Atariwriter+ (disk)

CARTRIDGE GAMES
1- Eagles Nest
2- River Raid
3- Wizard of Wor
4- K-RAZY Antics
5- Pac-Man
6- David's Midnight Magic
7- Ballblaze (XE)
8- Gorf
8- Pitfall
10- Startrek
11- Space Invaders
12- Miner 2049er
13- Bounty Bob Strikes Back
14- Kickback
15- Star Raiders
16- Atari Computer Chess
17- Missile Command
18- Joust (No docs.)

Basic rev. A cart. + Basic rev. C. cart. + Manual
74 disks from Antic and Analog Magazines (including plastic disk case)
Bonus - Frogger, Blue Max, and 11 Analog Magazine on cassette

BOOKS & DOCS
1- 400-800 H/W & OS manual (>200 pages)
2- DE RE ATARI + OS listing
3- Mapping the Atari Books (orig & revised issues)
4- Inside Atari OS Book (OS listing)
5- Programming the 6502 Book

HARDWARE
1- (5) Atari Joysticks + extra cord
2- Atari Paddles
3- 850 interface inc. power supply & SIO cable & Parallel
printer cable
4- Atari 1010 cassette recorder & SIO cable

For sale later:

Two 1050 drives (one with US doubler, other with Happy rev 7.2) will be available later. Also I have a really hacked (upgraded?) 400 with a B-Key keyboard, 256k memory, both the 800 and XE operating systems and built in Basic rev. C. With a three position switch, the machine looks like (1) a 48K 800 with original OS, (2) a 256K 800 with Mosaic RAM, and (3) an XE machine with Newell RAM. It also has baseband audio and video out. If anyone would be interested in such a beast, that will be available also. A SDX cartridge + docs. will also be available.

1710. MIO Cables: Say What??

Newsgroup: comp.sys.atari.8bit

Source record: 111456

Uh, thanks for addressing this topic again, Amos. Only, as I read your last post I couldn't make heads or tails out what you were trying to say. Putting the MIO IN FRONT of the XL?? Red lines on the cable? Huh?? I got the feeling I'm missing something...

I did once try to talk to someone at ICD, can't remember who it was. Got nowhere, the fellow seemed not to even understand what I was talking about, just kept saying 6" was all you use. I dunno, maybe I was talking to a salesman or something. I always get bummed out when I call up the experts & discover I'm better informed than they are.

I gather from Amos's comments- what I could make of it- that he is still referring to flat ribbon cable. All the pundits say ribbon cable doesn't work if you make it several feet long. There seems a contradiction... .

Has anyone tried round shielded cables?

1711. Soft/Hardware

Newsgroup: comp.sys.atari.8bit
Date: 1992-04-27 15:37:06 UTC
From: Amos.Jackson@f47.n282.z1.tdkt.kksys.com
Message-ID: <704385237.F00001@tdkt.kksys.com>
Source record: 111457

Well, I thought I'd throw in my pennys worth of thought along the lines of hardware/software likes.

DOS: SpartaDOS X 4.20 without a doubt! I love having the ability of having 9 disk drives, and knowing the tricks to have two of the same numbered drive online at the same time and knowing how to get the right one to work at the right time.

Text Editor: BBS Express Professional: Does ATASCII graphics, has a scrolling rate equal to 19.2K baud. Makes GREAT text files that can be used on a bbs or any other program without having to modify them.

Term PROgram (yep the hint is in the topic header): BBS Express Professional: I call all the boards I call without ever having o take my board down, while having all of the 1000's of options included in my bbs.

Interface: Without a doubt, ICD's 1 meg MIO (rev 2 - the one WITHOUT the unused 80 column port). Totally reliable product, and goes very well with the 1 meg 800XL that sits in front of it, and SpartaDOS X. It's nice to be able from time to time to have 2 megs of ram without even having to listen to any kind of mechanical drive.

Database: My system is for fun (mostly)

Spreadsheet: I spread all my sheets (of paper) on the floor.

Oh, one more thing about DOSes: I HATE ANY kind of menus, and anything that is AtariDOS 2.? or equal. My DOS table looks like this:

D1:DOS
D1:>DOS>A> 13 versions of SPartaDOS from 1.1 to 3.2d. 65 different fonts for use under SpartaDOS)
D1:>DOS>B
D1:>DOS>B>1>126 different command modules for SpartaDOS, 2 communicaions programs)
D1:>DOS>B>2>44 more command modules for SpartaDOS, and this keeps on growing)
D1:DOS>C>15 different command modules for SPartaDOS. You'd figure that all would be in the same sub, but these are Basic modules (everything from formatting a hard drive to placing ultraspeed on a DOS 2.5 disk).
D1:DOS>D>79 doc files for all of this good stuff.

So as far as ICD goes, I've seen alot of complaints about them, but I guess I'm one of the few who doesn't have any complaints except the fact that they've given up on the 8-bit, so I'll always like 'em. Also, the put out a DOS (either one - 3.2d or SpartaDOS X) that frankly in terms of performance and workability - no other DOS can touch it.

Amos Jackson

1712. SpartaDOS X and Databases

Newsgroup: comp.sys.atari.8bit
Date: 1992-04-27 17:01:40 UTC
From: un037406@wvnvms.wvnet.edu
Message-ID: <1992Apr27.124840.3036@wvnvms.wvnet.edu>
Source record: 111458

I was reading an old issue of Analog (sniff, a moment of silence please) yesterday and came upon an interview with the chaps from ICD. Now the artical was from 1987, just when ICD were getting ready to release the MIO, SpartaDOS X, etc. In the artical it was stated that SpartaDOS X was going to be released with functions to create/control a database. It seemed like pretty powerful stuff from what was being said. Now, my question is: Was SpartaDos X ever released with this code included? I have v4.20 and according to the manual the XIO statements that the artical said would control the database are not listed, and the database is not mentioned anywhere. Does anyone know if ICD developed any code at all, or if this idea was simply dropped in the planning stages. Any info would be greatly app.
thanx

> my score was around 327,000 + [or greater, only one I can remember].
>
> Another keul game is Draconus, which I have solved numerous times.

Yeah... I'm JUST getting to beating Draconus.. I THINK. I figured out
the exact purpose of the eye thing, and I found that staff that lets you
use those funky energy clouds as a weapon (sorta gets in my way tho, as
I'm not used to having them there when I jump...!)
Anyways... those doors on Draconus, are they just background, or will I
<eventually!> be able to open them... just the other day I got to some
bouncy bullet throwing dude, but that's as far as I've been.... also, do
the cloud bullets ever run out? They seem to be limitless, though there
are so many of them to collect around the game. BTW: I'm planning on
mapping it! :) (maybe.. unless I beat it first! :))

Anyways, back to Zybex.. I don't think it's repetitive.
Ya wanna see repetitive? Look at a few of the old >#1<
games ... Pac Man... Space Invaders... Asteroids
<yawn>.. Not saying I don't love them more than the 7 Nin-blender
games I have, but.... I think Zybex is a little bit better.. (a game
that can waste space using an enemy ONLY ONCE (that brain thing on one of
the >3 token< levels) is a good game!!!)
(esp. since it loads once into my little 48k!!!!)

1716. Read Atari disks on an IBM?

Newsgroup: comp.sys.atari.8bit
Date: 1992-04-28 02:00:24 UTC
From: andrewsr@utopia.rutgers.edu
Message-ID: <Apr.27.22.00.22.1992.12930@utopia.rutgers.edu>
Source record: 111462

I saw a mention of an IBM program which allows read/write of an Atari (8bit, ala 800) on an IBM 5 1/4" disk drive. Where can I get my hands on it? (ftp is best, or uuencode :-)

How well does the program work? I would like to use it to archive all of my Atari 800 disks onto another media. Is that possible? Could I use this utility to transfer an Atari modem package to my Atari and then get a modem to use?

What about disks that are protected (and required the Happy modification to copy)?

Thanks for any info!

1717. Re: Favorite 8-bit software

Newsgroup: comp.sys.atari.8bit
Date: 1992-04-28 02:43:21 UTC
From: esok@everest.ee.byu.edu
Message-ID: <7'@byu.edu>
Source record: 111463

Someone asked for favorites. Mine are:

1. DOS: I use DOS 2.5 99% of the time. I use DOS XL with my indus the other 1%.

2. Programming language: Action!, all the way. Atari Basic occasionally. Turbo Basic less often.

3. Text editor: I use SpeedScript by Compute! magazine. It's small, easy to read, fast to load and looks better than AtariWriter (it uses that special Antic character mode that allows true descenders on y,j,p,q.)

4. Communication program: I like Omniterm because it give me 80 columns (as I communicate with UNIX systems a lot and don't need file transfer much (I know Omnicom purports to have Xmodem and Kermit but I have been unable to get either of these to work).
Besides, I don't have an XEP80.

8. User interface: I like the unix interface, which is partially copied by DOS XL, but DOS XL is less convenient when you don't have a hard drive.

1718. Sparta Read for the IBM

Newsgroup: comp.sys.atari.8bit

here are my favorites:
1) DOS
MYDOS 4.51 because of it's compatibility to DOS 2.5 and of course
because it can handle 170K disks and copy from one format to
another.

2) programming language
assembler. It's so fast! You can programme everything in assembler.
For simple programs I like TurboBASIC XL. It has some great
graphics functions and it is fast, not as fast as assembler but
the speed is OK :-).

3) word processor
Speedscript 3.0. It's simple to use and sufficient for my use.

4) communication program
UTIL.EXE on the IBM-PC to copy programs from the archive to atari
disks.

5) spreadsheet
One integrated in S.A.M (see 8)

6) database
again S.A.M (see 8)

7) typing tutor
never used any

8) user interface
It is with no doubt S.A.M.
This user interface gives you an 80 characters screen with pull
down menus. It supports the ST-mouse as well as joysticks at the
same time. It looks little like GEM on the ST, has build in standard
file operations as well as a painter using 128 colors, a spreadsheet,
a database, a character editor in B/W and Graphics 12, memory scanner
word processor and a user interface. All these features work
with the ST-mouse

9) drawing package
again S.A.M

hottest hardware enhacments:-MIO is supposed to be good. I don't
have it but there are many people
who like it.
-my home brew sampler

My favorite hardware: my ATARI 130 XE!!!!!

1720. MIO Cables

Newsgroup: comp.sys.atari.8bit
Date: 1992-04-28 04:27:00 UTC
From: UJ1G@DKAUNI2.BITNET
Message-ID: <"92-04-27-21:27:34.87*UJ1G"@DKAUNI2.BITNET>
Source record: 111466

Well, I don't have a MIO but I'm almost sure the problems with
the long cables are related to the increase of capacitance of the
cables. This results of course in the corruption of the squarewave
which was already said by Jeff McWilliams.
The only way to ovecome this is to build a small interface between
the Atari and the MIO cable containing some TTL buffers (don't have
the 74LS??? number handy) which restores the squarewave.
Theoretically you could build more than one of these 'power up stations'
and place them in various distances from the computer making a daisy
chain like buffer-cable-buffer-cable-buffer-cable.....MIO.

(just an idea)

Source record: 111467

Regarding your question, the ONLY thing I can think of that even remotely comes close to this is the revision of the point command. Unlike MYDOS or other AtariDOS look-alikes, SpartaDOS-X's POINT and NOTE command require you only specify which byte number in the file to start reading from, no sector numbers are needed like the NOTE and POINT of other DOS systems. This could be a boon to a database program, which relies heavily on Random access of data within a file... as it would simplify the programmer's job dramatically... at least that's what I read out of it. Other than that, I never heard anything else about such a "feature".

Jeff McWilliams

Let's see, favorite DOS is SpartaDOS X. It is very lean on memory usage, but I would like to see some sort of technical programmer's documentation come out f or it explaining how to write my own DRIVER.SYS programs, and how to access the Kernel. I do understand SD-X CAN be tricky to program with every now and then though... it has its quirks.

Database: Turbofile for the XEP80.

Spreadsheet: Currently Turbocalc from Dataque software.

Word Processor: Torn between Textpro and Turboword+.

User interface: the CLI in SD-X works just fine for me.

Favorite game: Galaxians and Millipede oddly enough..

Programming language: no favorites right now.

Yes but won't this cause timing delays? I think 74HCT series would
be best... but even then you still have some delay.

1727. MIO Cables: Say What??

Newsgroup: comp.sys.atari.8bit
Date: 1992-04-28 15:08:02 UTC
From: Amos.Jackson@f47.n282.z1.tdkt.kksys.com
Message-ID: <704468087.F00001@tdkt.kksys.com>
Source record: 111473

I stated in looking at the MIO from the front of the XL (when it's connected to the parallel bus in it's normal position), pin #1 is the top rear position of the arrary of the 50 pin connection. As far as the ribbon cable goes, yes I do know someone who has a longer cable on his, but he seems to be having some connecting problems with his modem when making certain kinds of calls, so I don't think it's "smooth sailing" for him. All else seems to be working fine.

I have stuck to "if it ain't broke, don't fix it! I'm also lucky enough to have a computer desk that has enough room for my oversized hard drive case on it. The case can hold 4 half height or 2 full hight drives in it, and is now half full (2 half height hard drives). I'm not at all impressed with ribbon cable, but I do know that the shorter, the better, and with having about 6' of it between the hard drive and the MIO before I discovered a short and noticed the hard drive wouldn't boot, I chopped that down to about 5", and noticed the performance of read/write operations DRAMATICLY increase. So at this point, the issue of extending the length of cable between the CPU and the MIO continues. I'm still checking into it and will return with a further update.

Marek,
How can one get a copy of S.A.M.? Is it commercial, PD, or Shareware.
If it is commercial or shareware, how much does it cost? What are the
hardware requirements for S.A.M.? Can you give ordering info?
What is MIO and what does it do?

Keith

well, I don't have a MIO either, but I thought I'd expand
on this idea anyway. You could use 4 74LS244's to buffer
the address and control signals, and a 74LS245 to buffer
the data lines. The '245 is a bus transceiver, which has
a direction input, and buffers going both directions.
The only trick would be the direction and enable lines -
could probably use the Read/!Write line for direction, and
maybe the Math Pack Disable for the enable.
Probably only need 1 of these between the computer and MIO.

If anyone with an MIO wants to try this, feel free to email
me if you want pinouts or whatever.

In a previous article, moon!cyberden!phbill@well.sf.ca.us () says:

Everything in Draconus is merely background. Everything important is in the
foreground; there are no doors which you must go through.
Bets of luck mappin it out, as in the one spot you must jump off to the
left side of the screen and fall through 2 or 3 screens to get to the end
series of rooms which leads to the final Monster.

Zybex is a keul game. I mean its repetitive on what you have to do to move
on. But the graphics are awesome and so are the monsters.

BTW: I have made little programs which enable you to have Unlimited Lives
for both games. You can toggle back and forth between the two.

I've been looking at these posts from people selling their old machines,
and I have been drooling at the prices($30-$40).
However, all sellers have been somewhere in USA, and therefore the machines
have been NTSC-machines. Is there some way to convert them to PAL?
I have both a commodore 1701 and 1084 monitor that I can use(preferably
1701), and at least the 1084 accepts 60Hz.
What about the power supply; does it have to deliver something based around
60Hz? Would a new power supply from Atari Norway do the trick?
Same question for disk-drives. Does some have a builtin power supply?

Is there anyone who would like to sell me a PAL 800/800XL/130XE? (are there
any other versions I should consider? the 600XL has only 16K, the 400 has a
silly keyboard)

Some local guy wants to sell an 65XE(for ~$135!). What do you people think
of it?

Thanks in advance(e-mail would be nice)

As far as I know, all older Atari equipment [computers, disk drives, printer] used 9 VAC, so if you have a hefty 220 V to 9 V transformer, It should work. I've got schematics for the 800 Xl so if you get one & absoulutely have to convert it, I can get you the part values. Prior to the XL's, I don't think Atari had everything on the mother board to do the conversion. If you get a XL they use +5 VDC so any good regulated supply will work. A lot of people hack power supplies/cases. A fairly recent trend has been to get a cheap IBM clone case with power supply (they can be had for about $39) then tap into the +5 & +12 volts for computer & drives. I think the high priced 65 XE is, well over priced. The 65 XE is just a 800 XL with a cheap keyboard.

1737. Can I hook 1 SCSI HD to 2 computers, and more on MIO thread

Newsgroup: comp.sys.atari.8bit
Date: 1992-04-29 08:14:08 UTC
From: cs331333@umbc5.umbc.edu
Message-ID: <1992Apr29.081408.11659@umbc3.umbc.edu>
Source record: 111483

Well, I'm finally back in atari 8-bit business after my tragic loss of
a 256k 800xl a little over a year ago. I now have 3 800xl's, 1 1megMIO,
2 400's, 2 1027's, 1 1020, 1 850, one 1050w/ doubler and 1 or 2 410's.

One note of advice though..
If you order from B&C ComputerVisions, make sure you realize
they have a no-return policy. After buying the 2 800xl's at a yard sale, I
decided to mail the 1 800xl I ordered from them back (It was unopened
from UPS and had just arrived when I bought the 2 other 800xls).
They refused to accept it and said that "All sales are final" was
in all of their advertisements.. oh well..

The following text gets somewhat technical with regard to hardware,
so you might wish to skip it.

Anyway, I was wondering if anyone could answer a question for me. The
MIO has a SCSI connection, and I was reading somewhere that two
or more computers could share a single SCSI drive (I lost the article).
I was wondering if it would be possible to connect a SCSI drive to
both a MIO, and a 486. I was planning on running a null modem cable
to the MIO's comm port and having the two computers communicate via
that but unfortunately, it was only after buying the needed equipment
(A comm3/4 card, and null modem cable) that I found out that only
2 comm ports can function at one time on a ISA bus. This presents
a problem due to the fact that I have a 19200 Dataphone connection
to our UNIX system, and a mouse, and these basically tie up both IRQ's.

I was thinking that an ideal situation might be to buy an inexpensive
SCSI card (if they exist) and hook an inexpensive 10 or 20 meg. SCSI
hardrive into both computers. This would allow me a bit of freedom
because I could store atari programs on the SCSI drive and back
all my programs up on 1.44meg 3 1/2" disks and eventually even on
mag. tape. I would like to know if this is possible and some cheap
places to buy the required hardware if it is. Also, I'm not sure
how long my 1050 will last, so having the alternative of using 3 1/2"
disks would be nice.

As it is, I am planning on buying IBM's new OS/2 v2.0 and doing some
serious multitasking so having a second harddrive dedicated to the
Atari/MIO combo would be very convenient. I am hopeing that at
least one person has thought of and implemmented this idea already.
Since there has been alot of traffic on MIO "extension cords" I
assume a fair share of readers of this group at least own MIOs :-)

Also, just my $.02 on the "extension cord" issue. I recall reading that
the MIO can basically be thought of as an extension of the mother board.

Although the shape of the wave has been examined and its been noted that longer cords change it, I still think that trying to seperate the two units (motherboard/MIO) by a great distance would create other problems. The speed of light is only so fast and the MIO deffinately controls the CPU at least to some degree as evidenced by the ability to change logical drive numbers, interupt the printer control, and even give the setup menu on powerup with select held down.

Basically, I bought my MIO a LONG time ago. In fact, when I bought it, atari was still alive 8-bit wise and I actually received it in the mail just before all the die hard atarians noticed that ICD was having problems picking up the memory chips for it and delays in order processing happened. (Anybody else old enough to remember that happening?)

Anyway, I was very interested in anything about MIOs at the time and called numerous BBS's out of state and the common consensus among BBS operators running systems with MIO's was just that it was impossible to seperate MIO and computer by more than the enclosed cable. It was also commonly said about how the harddrive should be kept as close as possible to the MIO (It might even be mentioned in the manual). Anyway, thats just my $.02 and hopefully someone will try out Todd Greenfield's suggestion and I will be proven wrong. :-)

That stupid
short cord deffinately gets in the way. The only reasonable workaround I found for having my setup in a small deskspace (ie not deep enough) was to buy a 1/2 height milk crate, thread the wires through the holes in the milk crate to the MIO (which sat it the milk crate) and set the monitor on top of the milk crate. It was scarey the way the crate sagged but everything was well ventilated and the monitor never fell. (it was a commodore 17?? monitor, REALLY deep).

Anyway, you all will probably be seeing alot more of me on this group, and hopefully be reading some articles by me once the all 8-bit atari magazine is finalized (I just received the postcard info and will put it in the mail today. Thanks Jeff !!)

I will probably post a less atari-8-bit oriented message on comp.ibm.pc.hardware asking for 80_86 oriented SCSI info so any info on the atari side of it would be appreciated. I don't mind if you get technical with it.. :-)

That's a bit unfair calling a 65XE an 800XL with a cheap keyboard! The 65XE is really a shrunk down 130XE but has all the advantages of the new range: smooth running, clear TV output, etc. Also, the 65XE uses a 130XE PCB with the extra RAM chips missing and the controller chip missing. But, it's quite easy to add these later. But, $135 is a bit steap!

Sorry about the comment Dean, but I REALLY hate those mushy keyboards that the Tramiels have been using in every computer they've been responsible for. I've just got a copy of Write On for the ST & I like it's features, but even the ST keyboard is so bad I'll probably end up using a clone for typing then reformating on the ST. I'm a little biased since I have done a lot of typing where I used to work & since I returned to school. I'm starting a new job on tuesday & it looks like I won't need to do any typing so maybe I'll lighten up <grin>. Heck! I even canabilized one of 800 XL's & transfered the Rambo, OS, etc to a 1200 just to get a better keyboard.

Marek,
Thanx for the info on S.A.M.
I have two more questions. Is there an english-language version of S.A.M.?
Is there an english-language version of "AtariMagazin"?
I hear that there is a lot of commercial software development going
on in Europe, especially Germany, for the Atari 8-bits, and I would
like to stay "up" on it. I don't speak German though, not even
"high school German". Am I out of luck?

DON STEIBEL,

I think it was Don Lancaster who talked about SCSI sharing devices. He was writing about Postscript laser printers that had SCSI ports on them. He would hook up a hard drive to the laser printer and his Apple MAC type computer, and then write the file out to the hard drive at SCSI speeds. THen he instructed the computer via an Appletalk cable going from the MAC to the postscript printer to look on the hard drive for the file to print. So apparantly it works, just make sure no two devices are trying to use the hard drive at the same time. As for the IBM being able to recognize and read/write the Atari partition on the drive, I don't think this is possible. THey probably format differently and set up their DISK structure differently. One thing I do know about the MIO is that all data written to a hard drive is actually inverted.... I got that from Bob Puff's documentation on the Black Box.

If given a choice of the two I would have to go with the XL. Lack of a PBI, baked beans for a keyboard, and function keys that go bad more often then child actors seriously outweigh the cleaner tv output. Just on this fact alone I would pay more for an 800XL than a 65XE. But not $135.

I would like to know a little information from the 8-bit owners out there. Does anyone use/purchace disks from PD library companies? Do you feel that it is worth paying for disks of PD software? Why/why not? At what price would you be willing to buy PD disks at? Are there too many/too few PD supply companies supporting the 8-bit? I am asking this because I am thinking of starting a PD library myself. Obviously I don't want to sink a lot of time and money into this operation only to fall flat on my butt, so I would welcome any thoughts/comments.
please e-mail replies

1745. MIO Cables/NTSC-PAL Video

Newsgroup: comp.sys.atari.8bit
Date: 1992-04-29 22:42:04 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9204292242.AA24388@smithkline.com>
Source record: 111491

According to bob Puff, Jeff McWilliams is right in questioning the wisdom of placing <Schmitt trigger> buffers in addrress/data/control signals, due to the induced timing delays which throw the various signals out of sync turn the computer's brain into Jell-O. *sigh* I'm gonna be away from the Net for awhile (taking a week's vacation), perhaps I'll devote a day to looking into this problem scientifically since it appears everyone else- including Amos- is as much in the dark as I am. Mayhap upon my return I'll be able to shed some light on all this??

My office area at home is rather cramped, I don't have the luxury of spreading my system over several acres of tabletops, etc. I'm sure I'm not the only person in the world w/this problem. I considered mounting my host adapter in a 2" thick metal box placed under my XL console, but that arrangement blocked access to my 5.25" floppy drive which is about 4" behind my console. Another brilliant idea down in flames.....

I think Boerge Noest's video problem is much simpler to cure than this MIO cable thing. Converting from NTSC to PAL is- as far as I'm aware- a straight-forward hardware hack. At least on the 800XL, whose circuit board I have in mind. The XL generates all its video, including sync, from on-board components all drawing power from the +5V line, nothing is synced to the 60Hz AC power source. The hack would involve removing the NTSC-generating components & installing the PAL components whose locations are already screened on the board. The parts are not much- a transistor or 2, I think a CMOS gate chip of some sort & the PAL crystal (4MHz???). Plus a jumper or 2. It could be done just by working from either the Atari or Sams schematics, all the parts are listed w/designations as to which are for PAL & which are for NTSC. The tough part would be to adjust the color, which would have to be done directly on the PAL monitor using appropriate softwarte such as the German Testbild or Analog's Colorbar programs, both are good if your eyes see color correctly (heh-heh).

No, I will not mail schematics to people as that material is commercially available from Best, B&C, or ATV. The video adjustment software is available from most of the PD distributors; I suspect Testbild would likely be found on BBS' in Europe.

Of course, I'm assuming you already have a +5V supply that drws its power from whatever the AC mains is in Norway, probably 220V/50Hz. Never having seen a pwr supply for a European Atari I'm sure if the only difference is the plug on the end of the AC cord. I'd be willing to bet the pwr transformer for European supplies is different also, but all the components on the xfrmr secondary should be the same.

Hmm... I believe I have MyDOS v. 4.56/4?? (the /4 or /3 is for the
directory list values... 4 or 3 digits (3 like in 2.5, 4 like
in...well... MYDOS! thats good for h/d's, etc. (ie, "999+FREE SECTORS"
doesn't really tell much, except when you only have just over 1000!)
(unfortunatly, tho, "/4" isn't the BEST with AtariWriter+ or my GOE
demo., but I got me spartados now, and just seeing the 1st 3 digits of a
textfile is okee dokee!)

Anyways. PLEASE explain this S.A.M. program! The only SAM I've
ever heard of was from Don't Ask Software .. it was a voice sythnesizer
built into software (ie, use it for your own programs, etc.)
I've only seen THAT on my brother's c=64, but I know I can get
it. (BTW: wasn't it one of you out here in net-land who said they had a
copy they'd get me?? or was it someone else??????)

>Marek Tomczyk

for a 74HCT244 with output capacitance of 50pf, the delay is 14ns,
and for 150pf its 20ns. It is very possible that this would
be too much delay. I don't have very details timing specs on the
bus, just what was in Antic. But I still think it would work :-)

Now a question: I've got a couple unmodified 1050's, and I'm
thinking about getting a US doublers or Happy. Are both still
available? USdoubler gives high speed I/O with Sparta, right?
What about Happy? What are the advantages of each? I seem to
recall that Happy is more expensive. Is it worth it?

and a MIO question: I know you can use SCSI stuff, but what
about a RLL drive?

I don't think so. 1.79MHz isn't that fast. As far as I know, buffers
like 74LS244 and 74LS245 (thanks Todd) are used in various controller
interfaces for IBM computers and they do well. If you want to be sure
you can of course take 74HCT types, the price is not much higher.
Hardware is always very fast you don't have to worry about it, at
least in this case.

1752. S.A.M. and MIO (was Re: Favorite 8-bit software)

Newsgroup: comp.sys.atari.8bit
Date: 1992-04-30 04:55:00 UTC
From: UJ1G@DKAUNI2.BITNET
Message-ID: <"92-04-29-21:55:09.50*UJ1G"@DKAUNI2.BITNET>
Source record: 111498

in a previous article Keith.R.Smith writes:

> How can one get a copy of S.A.M.? Is it commercial, PD, or Shareware.
> If it is commercial or shareware, how much does it cost? What are the
> hardware requirements for S.A.M.? Can you give ordering info?
> What is MIO and what does it do?

S.A.M is commercial software. Few years ago it was printed in some
issues of the German 'AtariMagazin'. This was a huge series of articles
and listings. Now this software is still being commercialy sold by
the publisher. It isn't cheap though. The same version that has been
published in the magazines costs 49DM (devide it by 1.67 than you have
it in $), there are additional disks for it like the S.A.M. Designer
(19DM), S.A.M. Patcher (12DM) and a supplement (24DM). They also
sell the whole package with all additional disks for 79DM.
But there is still another, cheaper possibility to get S.A.M.
You can by the back issues of 'AtariMagazin' for 3DM each. As far
as I remember you'll need 5 or 6 issues since it was a series.
Hardware requirements: You need an Atari 8-bit computer with
at least 48K, a disk drive, joystick and your TV set. Nothing
else except you want to use a mouse. S.A.M. supports a ST-mouse
plugged in into the second joystick port. You can leave the joystick
in port one and use the mouse and joystick simultanously.
You don't need an extra 80 charcters card like XEP-80. The 80 chars
screen is emulated by software.

Now the address of the retailer:

Power per Post
Postfach 1640
W-7518 Bretten
Germany
Tel. (code for Germany) (0)7252/3058
Fax. (code for Germany) (0)7252/85565

or Verlag Werner Raetz (Power per Post)
Melanchthonstr. 75/1
W-7518 Bretten

You can ask them if you still have questions.

Now MIO.....
as far as I know MIO is a kind of interface to be plugged into the
parallel port. Then you obtain the possibility to connect SCSI hard
disk drives and other SCSI equipement. An additional feature is
the built in memory upgrade with possible size of 1MB. There are

sure other features but I don't know exactly about them.
It sounds very good and who knows, perhaps I'm going to buy one
some time :-). I think it is sold by ICD in the states.

1753. NTSC Atari in PAL-land: what problems will there be?

Newsgroup: comp.sys.atari.8bit
Date: 1992-04-30 05:15:00 UTC
From: Henry.Miller@f47.n282.z1.tdkt.kksys.com
Message-ID: <704610417.F00001@tdkt.kksys.com>
Source record: 111499

ALOT of potential problems. First the good news: the ATARI power supplie will be good on the XL/XE. on the rest, your different line speed may matter, I'm not an expert on how Atari did it, but the C64 used 60HZ power lines for the timing, and would run slower on 50HZ lines. If you have access to the comadore base, ask a technical person there is the comadore monitor will handle the different speeds. It may do it already, or just need a crystal change.

MANY possibal probelms. First, the IBM is uasally 512k sectors, and Atari is sothing else(either 128 or 256) That is the first probelm, Second: SCSI is designed so that all adapters have priority numbers. IF 2 computers are on the bus and want to use the prot at the same time, the one with the higer number gets the bus. Unfortunatly I don'T know if many boards for the BIm support this, and doupt that the MIO does.
The specs for SCSI state that the cable should go to 18 meters without trouble (54 feet)

You Null modem problem may not be sunk yet, SOME IBM cards can put a different Irq on the serial port, but then you need to find software to recignise it. (Telix will recignise a different Irq- I used to have a modem on 5- but most programs won't)

>

Yes, the US Doubler modified 1050 drives will operate very fast with
SpartaDOS or SpartaDOS X. The Happy upgrade will also, the reason it
is more expensive is because the Happy also has software for making
archival back-ups of protected software. The Happy will also operate
darn fast with just about any DOS system. If you own the Ultra SPeed
Plus operating system from C.S.S., you can get high speed I/O with
any of the 1050 modifications using any DOS. This also applies to
owners of the Black Box.
Computer Software services still sells their own version of the Happy
called the Super Archiver, but you will have to check around the
U.S. vendors for the other upgrades. Try B&C, BEST, American TV, the
usual places.

>and a MIO question: I know you can use SCSI stuff, but what
>about a RLL drive?
>

If you haave the appropriate SCSI to RLL controller, the MIO can
operate these drives. I believe the Adaptec 4000A is a SCSI
to MFM controller, and the Adaptec 4070 is a SCSI to RLL controller.
They run $90.00 and $130.00 respectively from C.S.S., or you could
go digging in some computer magazines looking for cheaper prices.

As people will probably know, I have run a PD library in the UK for about 4 years now. Over the years I have supplied many disks, and now have a library of 125 disks. It could be a lot more, but in fairness to other UK PD libraries, I only supply PD which they don't carry themselves. People are prepared to pay for PD disks, but don't try and get rich quick. People won't be interested if PD ends up costing more than commercial stuff! I charge 2pounds a disk, or have bulk purchase discounts of 10 disks for 15pounds, 20 disks for 25pounds. It's suprising just how many people actually take advantage of the bulk discounts. In order to keep prices low and efficiency high, I run the library like a business, and issue invoices and the likes, and have official order forms, etc. It seems that people prefer it done like this. But, you must try and keep things very informal, and try and answer peoples questions and queries. Running a PD library takes a lot of time and patience, but it's worth it!

I just finished browsing the 8-bit section of a recent issue of Zmag,
(#202, I believe) and there was mention if a company called
ReeveSoft that produced a graphical operating system for the Atari 8-bits.
This product comes in both cartridge and disk versions. They were featured
in the June '91 issue of ATARIUSER magazine (which I did not get)>

Here's the "rub". The phone number listed in the Zmag article for
ReeveSoft (312-393-2317), is no good. I called directory assistance
for Warrenville IL, and they have no listing for ReeveSoft.
Has the company:

moved?

changed their name?

gone out of business?

Has anyone out there heard of them or used their products?

Keith

Let's see if I can get this transferred properly <g>. I've been hanging out on Forem NET boards lately & the 8-bit sigs are not really doing that well. I picked a post off the 8-bit sig for the Forem boards that carry the 8-bit sig, sorry no numbers. I just wanted to say a good way to show continued 8-bit interest would be to participate in the NET. Atari's company BBS is part of the Net & Bob Brodie from Atari routinely answers questions. Please don't flame him about lack of 8-bit support, it's already happened so much somebody should stick a fork in him 'cause he's done! I'm only posting the boards that have the 8-bit sigs since the ST SIGs are not really fond of anything but ST users in their sigs & constantly flamming each other. Other then Carina Net & here, there aren't a lot of places we can get together & if the Forem Net drop the 8-bit SIGs for lack of interest we'll have one less!

Source record: 111408

According to Appendix D -- Hard DRive Data, part of the docs that came with the MIO (I have a 1 meg), there are a few drives listed that are RLL and MRLL that can be used with the MIO. Manufactures listed are Lapine, Miniscribe and Seagate, but this is only a partial list of drives that can be used with the MIO. It is also mentioned that RLL controllers are required for RLL drives, and MRLL stands for Modified RLL (the Adaptec 4070 was listed as an example of a RLL controller).

According to other sources, Reevesoft has gone out of business. I can not confirm this, but I haven't seen Alan Reeve on GEnie in the past 5 months before cancelling the service two weeks ago. He had a section in the Bulletin boards there for Diamond and Reevesoft products.

The business was basically run out of his parents' home, Alan was a college student. So perhaps you could ask directory assistance in the town of his address for a phone number and find out what is happening.

I would be interested in knowing what happened to Diamond and Reevesoft, so if you discover anything, please post to the Comp.sys.atari.8bit or Info-Atari-8 for the rest of us.

>
>What exactly is a PBI?
>
>Keith

This is the Parallel Bus Interface, found on the back of the 800XL and 600XL computers. It was offered on the 130XE in a different form, as the Cartridge port and the ECI (Enhanced Cartridge Interface). Unlike the SIO port, the PBI could transfer data 8 bits at a time, and there is also special code in the OS ROM to look for special PBI devices. If such a device existed, and contained a ROM on it configured properly, the OS would download a device handler from the ROM on the Parallel BUS and place it into the HATABS table, which is a table containing vectors for all standard device handlers, like E:, S:, P:, D: (when DOS is loaded) etc. Up to 8 PBI devices could be put on the parallel bus and accessed in this manner.

But the Parallel Bus can be used in different ways, either more simple or more complex. The Microport XL is a PBI experimenter's kit produced by Supra Corporation back when they were selling Hard Drive interfaces for the Atari XE/XL computers. This little board has a PIA chip on it which could be addressed to one of several unused locations in memory. Then by reading/writing to these locations you could access the PIA much like one access the Joystick ports, which are actually using PORTA of the internal PIA for joysticks 1 and 2.

The MIO from ICD and the Black Box from C.S.S. are highly complex devices which connect to the Parallel BUS or ECI, and offer a wide range of features.

The MIO offered RS232 and Parallel printer ports, and a SCSI/SASI port for connection of Hard Drives. Additionally, depending on whether the unit came with 256K or 1024K, this memory could be used as a print spooler and/or a RAMDISK which DOS could recognize. The MIO could also do I/O redirection for disk drives. You could tell it to take your 1050 floppy drive which you normally configured as Drive #1 and make the computer now think it was drive #5.

The Black Box in its standard configuration also offers the printer and RS232 and SCSI/SASI ports, as well as the ability to call up a screen dump utility contained in the ROM on the Black Box. It also has a 6502 monitor debugger callable. You could also tell the Black Box to use some of the extra memory inside a 130XE or similarly

upgraded 800XL as a print spooler, or you could install 64K on the
Black Box itself to do the same thing. There is a new enhancement for
the Black Box which improves the screen dump features and has a
sector editor/copier on it. I am a little bit vague as to the exact
features on this, recalling all of this from memory of what I've read
about it. Just released for the Black Box is another enhancement
called the Floppy Controller which allows IBM standard floppy drives
to be connected to it and be accessed by the computer
at blazing speeds.

Well, this isn't everything one can know about the PBI, but it is a
darn good start. Antic had a 4 part series on the PBI way back when.
It offered a detailed, highly technical, and sometimes confusing
look at how to build devices yourself to plug into the PBI.
I also think I found at least one bug in the sample code offered
in the magazine.

Bob Woolley of the SLCC journal and available on compuserve
has done quite a bit of experimenting with the Parallel Bus, and has
even done a modification for 1200XL computers to add the Parallel
Bus to them, along with the 800XL OS, and optionally internal REV. C
BASIC.

There was also a short article in Analog Magazine that showed
how to put additional memory on the Parallel BUS useable by a
16K 600XL. There are also two different 64K upgrades for the 600XL
that simply plug into the parallel BUS. Supra did one, and Atari did
one. I believe BEST has some Atari versions.

Atari at one time was going to design a product called the 1090XL
which was a box with card slots in it. Into this you plugged
memory cards, I/O cards, or any other sort of goody you could dream of.
I've seen some preliminary specs, and a few of these items are in the
hands of Rabid 8 bitters, but it never was officially an 8 bit product.

On a bit of a tangent to this topic, I've witnessed the emergence of
some math intensive software lately for the Atari 8 bit. ChromaCAD
XE comes to mind, and I know of other software either on the drawing
board of almost complete which also is very math intensive.
This makes me ask if there is any way a math coprocessor could be
added to the Parallel BUS. My initial thoughts were of the 68881
math coprocessor from Motorola. But lately I've had another idea.
The Atari Lynx uses a version of the 65C02 running at 8 mHz, and
I believe Western Design Center sells standard 65C02 CPU's in 8 mHz
models. If not, they sell its big brother, the 65816 at 8 mHz
rates. An intersting thing about the Parallel BUS is that when
a official Parallel Bus device is recognized, and it's handler code
loaded into HATABS, the actual code from the Parallel Bus device's ROM
appears in the same area as the FLoating point routines. This is
when the MPD (Math Pack Disable) line on the Parallel BUS is active.
I think it is possible to design a circuit to keep the MPD line always
active, thus having some custom code sitting on a ROM out connected to

the Parallel Bus always active and residing in the memory location that
the Floating Point Routines usually reside. How does this help?
My thought process came up with the following idea:

Take the OS ROM floating point code, put a 65C02 running at 8mHz
on a card, with the floating point code, 32K of Static RAM, and a PIA.
On the same card, place a ROM chip and circuitry to always keep the MPD
line active. This way the code in our special ROM chip replaces the
internal floating point routines at all times.
When any program makes a call to the floating point routines, it calls
the code in the custom ROM. The custom ROM talks via a PIA on the
Parallel BUS to the 65C02 running at 8mHz, sending it the two
Floating point values and which function is to be performed on them.
The 65C02 takes these values and just accesses the Floating Point
routines exactly the same way the computer would have, but since
it is running at 8mHz, the operations will be done much faster than
the Atari computer could do them.
When the 65C02 finishes, it sends the result back via the Parallel
Bus to the Atari computer, and it is placed in the same area the
standard floating point would normally place it.
The net effect is that to the computer and the software using the
floating point routines, everything is exactly the same except for the
speed improvement.
The result? Floating point calculations done at greater than 4 times
the speed of a standard Atari, with no internal modifications needed
to be done to the computer. Additionally, since the 65C02 has all
sorts of extra memory to play with, some of that addressing space
could be used to store look-up tables for trigonomic functions.
These wouldn't be able to be callable from the standard Floating Point
routines in the Atari, but any software that needed them could call
this "coprocessor" and have lightning fast trig. calculations.
This concept could be expanded even furthere, having the 8 mHz CO-
Processor do all sorts of data manipulation and computations that
would normally take a long time on the standard 1.79mHz 6502 in the
standard Atari computer.
Another thing that came to mind would be to have the CO PROCESSOR
actually read the Floating Point routines off of the Atari OS ROM
and place them in non-volatile memory that it can access.
Why do this? Because if you have the Newell Fastchip F.P. routines
in either the OmnimonXL chip or Omniview 256, then the co processor
will use these faster routines, for EVEN FASTER calculations.

What makes the idea so elegant is the following.

Doesn't require internal modification of the computer. Everything
is packaged on one plug-in card.

Since it replaces the standard Floating Point routines, ANY
program can take advantage of the speed without knowing it
exists. BASIC, Lightspeed C, Action!, almost every other
programming language including the Machine Language

Floating point Macros for MAC/65 publishied by Antic all used the
Floating Point routines in the OS, and would therefore
benefit from such a coprocessor board.

It shouldn't be too expensive.. the major parts are as follows:

65C02 running at 8mHz.
OS ROM for the 65C02, containing basic startup code for the 65C02,
communication protocol for talking with the Atari computer, and
an exact copy of the floating point routines contained in the
XL/XE ROM.
OS ROM that appears in the Atari computer's floating point address space.
contains communication protocol for talking with the CO-processor.
Static RAM for the 65C02 32K runs about $12.00 but could use less.
Two PIA chips, one for the Atari computer, one for the 65C02 for
talking to one another.

Glue circuitry.

Would it be worth it? I don't know the exact cost, but if I ever get
some cash I will probably give it a try.. maybe not for a while though
Are there any other hardare enthusiasts out there who are interested in
this and have the ability to work on such a project?

Well Keith, I am afraid you got much more than you bargained for
as an answer to your question. I apologize if I overwhelmed you,
I wanted to present this idea to the rest of the 8 bit readers and
your question present me with the perfect opportunity to do so.

Jeff McWilliams

1765. Interested in PBI Information.

I am interested in trying some hardware hacks using the PBI. But,
I can not find information pertaining to the PBI. I checked "Mapping..."
but it merely says its a vast topic and refers me to 3 Back issues of
Antic (1987 I think. I dont have the book with me right now).
Are there any other sources for PBI Information, specificly the programing
and handleing of external PBI devices? I have the 'general' material that
"Mapping..." states. I was thinking maybe AIM or some other news magazine
had articles on them. Or possibly someone would be willing to sell me those
Antic magazines or a copy of that information.

Thank you for your support.

Source record: 111415

(this doesn't have much to do with the title, but it does have to do with a MyDOS "feature" I've lately noticed...)

When you want to use the "*" wildcard, you need NOT add the "." before the extender. Wow, you say. (shut up, I'm not finished yet!). Anyways, another nifty feature (not sure if it exsists in SpartaDOS) is the filenameext rather than filename.ext ability it has. Wow again!, you say. (shut up, I'm STILL not finished). Anyways, sure these are pretty useless, etc.etc. (then again, I'm for speed when it comes to computers. To load BobTerm, I just hit "LB**" and return. :))

Well... here's something I did to trick Jeff Potter's ColrView (haha! and you thought it was fool-proof!). Anyways, I wanted to load up a single-file picture for a second, and didn't want to have to leave. I thought, "gee, I wonder if Jeff made it replace extenders if there are any?" so I tried to load "filename.gr9". It didn't work. I'll suppose it replaced the ".gr9" with a ".g". So then I thought, "well, I know it adds the ".g"'s, etc.etc. to the >end< of the name-string, so if I were to use something like "filenam*gr9", forgetting about the "." and letting MyDOS take care of it (unfortunately, this can't work if you have files named "filenama", "filenamb", etc., but how often does that happen!? anyways, just replace it with "fil?nama", "fil?namb", etc.).

Back to the point of this babbled gibberish. I typed in "filenam*gr9", and it, I guess, tried "filenam*gr9.g", "filenam*gr9.b", and "filenam*gr9.r". (this'd be a nice way of testing your r/g/b/hue values for perfect colors (white, in this case)). When it did this, it just loaded the 1 file 3 times, turning it into a b/w picture. I suppose if I were to (dangerously) remove the disk right between loads, I could remove one of the colors. Ok, so what, you say? So... this is a little feature of MyDos that I've never seen (or have forgotten!?.. I don't think so. Like I said, I'm for SPEEEEED....) documented. So THERE! Thanks Bob & you guys for that spiffy DOS ya made. I STILL like it better than SpartaMess... :)

BTW, Jeff.. have you ever considered making a version of CV with the ability to load 1 HUGE .RGB screen? (ie, rather than using Apac to load, save as r, load, save as g, load, save as b.. just load, save, load, append, load, append. I'm not saying to re-make the format of CV files, but perhaps just add this as a way of loading files into it.. or did you think of this already and avoid it for some reason that is totally unobvious to my meager mind!??! :))
ok.. I'm done... you can wake up now! :)

1771. Re: What is a PBI?

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-01 00:44:24 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <58265@cup.portal.com>
Source record: 111417

Well, neither here nor there, but a while back Steve Cicara <sp?> of Byte fame came out with a co-processor board for the clones. It just used a bunch of 8031's as co-processors on a card with a fast serial link to each 8031. I can't recall all the details, but I believe he had a couple of dozen 8031's & he'd transfer the operation he wanted done to each one i.e. 8031 #1; you find the square root of 3. 8031 #2; you find the square root of 4. Ad infinitum (whoops! make that a dozen) by the time he gave all the 8031's their task, the 1st one had already finished. In concept you're right, I'm not to sure about execution of the design or choice of parts, but then since I haven't got much to offer myself, I can't be too critical <g>. You know I've been programming in M/L for about 25 years now & I can only recall a couple of instances where I absolutely HAD to result to FP. I could get behind a ATD T2534280
Whoops! Macro key! CONT: behind a 16 MHz 68000 on the bus with a fast serial link to the 8-bit, but I have no idea about the amount of glue you'd need to get a 68000 running, if you'd need latched memory access to access a 6551, & I don't do 68000 M/L yet & maybe never. I guess I'm just thinking about what you'd need that kind of processing power for. Fractals? Weather predictions? IMHO: Except for a few math majors who want to do Mandelbot's/Fractals it'd be a little to much club for the distance to the green. Well, I'll get off my high horse now. I've just been through one of the most incredible periods of my life as far as free time goes. I'll see if I can get caught up in pet projects including my parallel bus project. Suggest an application that more then 2 or 3 people can/will use & maybe I'll give it a shot. Remember: you can decode a single page to access 64-6551's and at full speed a 6502 (19,200 BAUD 6551's) can only keep up with 4-8 devices.

>
>Well, neither here nor there, but a while back Steve Cicara <sp?> of Byte
I think that was Steve Ciarca... heard of the guy from the days when BYTE
was a honest to goodness hardware magazine, and not just a caterer to
PC clones. Perhaps it's a sign of the changing times, and the move from
technical people to DISK jockeys.

>fame came out with a co-processor board for the clones. It just used a

Well, the upcoming 65832 will run at 10Mhz.... I think that will be
be quite fast enough, in fact the 8 mHz will be ample I believe.
If it was couple with the Newell fastchip routines, which claim 400%
speed inrease themselves, an 8 mHz setup would give 16 times the speed.

>link to the 8-bit, but I have no idea about the amount of glue you'd need to

>I don't do 68000 M/L yet & maybe never. I guess I'm just thinking about what
>you'd need that kind of processing power for. Fractals? Weather predictions?

programs like ChromaCAD XE , which has sold over 1000 copies, would
greatly benefit from such a device.. and I am thinking of something
along the lines of a CAD or vector based drawing program that would be
highly math intensive.

The reason I wanted to stick to the 65c02 is that the floating point
code could be copied directly from the OS to the 65C02 ROM. I wouldn't
have to reinvent the wheel for floating point stuff. a project I would
never have time to tackle.

>IMHO: Except for a few math majors who want to do Mandelbot's/Fractals it'd

>(19,200 BAUD 6551's) can only keep up with 4-8 devices.

Is there anyone out there who would be interested in seeing this
coprocessor project become a reality? Or am I offbase in thinking there
is an actual need for faster math calculations?

I'd say the speed you'd want to benchmark yourself against would be
say a 286/287 combo, or at least a fast 8088/8087... That has all kinds of
uses. Why not a fast interface to an IBM PC card? That would have loads
of other uses too.

>programs like ChromaCAD XE , which has sold over 1000 copies, would

I'd be willing to bet that ChromaCAD uses intensive table lookup... it
might not even use floating point at all. This is very common in FORTH.
Anybody actually look at the code? Am I way off base here?

>The reason I wanted to stick to the 65c02 is that the floating point

I think a lot of this is nostalgic fondness for the 6502 series. I'm
guilty of it too... most of my "gedanken" designs involve a 65c02 or
65816. I think it wouldn't be that hard to build a really slick PBI
interface to a PC clone motherboard that would include floating point
routine emulation, and could do other things like give you very fast
access to peripherals... Would be neat to do under something like Linux
or Minix instead of MS-DOS.

>Jeff McWilliams

Just my two cents

I wonder.. HOW about rip the chips outta the 65xe, plug 'em into a
1200xl, and then add a PBI port? (I'd just go for some better
TV/chips)...but....

Umm....geez... lemme see...!! Well.. if I'm not mistaken (I aint got one (boohoo!!!!!) on my 1200xl) it stands for "Peripheral Bus Interface". From what I've seen, it's good for hooking up doo-dads (like chips, etc.) BUT, the best use is high-speed data transfers (??!?!?!?!) ie- the MIO (??) and Blackbox connect to it.

HELP! I guess I dunno either!! :0

Hi there,

I'm posting this for one of my friends who is an 8-bit nostalgist...

He's searching for an Adaptec MFM 4000 controller (or 4000A, 4010) and a Seagate ST-506 or ST-412 drive for hos MIO. Anyone having these items or info about where to get them (as well as info wheter these are behaving good or not with the MIO), please contact Vidar Olavesen, Stevneveien 7, N-1720 Greaker, Norway or me on jonal@sofus.dhhalden.no

BTW, he fried his MIO when attaching a ST-225N to his MIO. The manual said SCSI drives would work...

Thanks!

I recently sold my Atari 400 computer and have the following
software items that are looking for a good home.

If you are interested, please reply via email.

- -

Prices below do NOT include shipping (from the Cincinnati area)

- -

SOFTWARE: ($5.00 each or $25.00 takes all)

ATARI Basic Cartridge (ATARI Corp.)
- complete with original manual on MINT condition
- includes storage case for up to six (6) cartridges

Timewise (ATARI Corp.)
- calendar software
- includes original disk, packaging and manual in MINT condition

CheckMate (Mastertronic, Inc.)
- software to manage your checkbook
- original disk in MINT condition and packaging but no documentation

PrintShop (Broderbund)
- design and print banners, posters, greeting cards, etc.
- original disk, manual and packaging in MINT condition

Print Power (Hi Tech Expressions)
- design and print banners, posters, greeting cards, etc.
- original disk (Commodore "flippy" disk), manual and packaging in
MINT condition

AwardWare (Hi Tech Expressions)
- design and print award certificates
- original disk (Commodore "flippy" disk), extra graphics disk, manual
and packaging in MINT condition

Creative Process 1.8 (Antic Publications)
- Outline software
- original disk and printed copy of documentation in MINT condition

Antic Publications Disks (unused, MINT condition)
- August, 1989 - "Return of 'Mapping the Atari'"
- September, 1989 - "Joystick Laboratory"

Backup Master (Computer Age Software)
- disk copy utility program

- original disk only (no docs) in very good condition

1781. MAIL-IN CAMPAIGN A SMASHING SUCCESS !!!

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-02 20:37:04 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9205022037.AA10171@smithkline.com>
Source record: 111427

******************************** ATARI CLASSICS **************************

******************** MAIL-IN CAMPAIGN: FINAL REPORT ******************

A mail-in campaign to poll support for an independent Atari 8-bit magazine, to be called ATARI CLASSICS, was conducted during the 3-month period of January 15-April 15, 1992. The goal of the Campaign was to collect 500 hard commitments from individuals willing to spend $25 annually for a subscription to such a publication.

The Campaign was conducted by a Campaign Committee consisting finally of six people, two in the U.S. and the other four in various countries around the world. The Campaign was managed and largely financed from the U.S.

The Campaign Committee is pleased to announce that the mail-in campaign WAS A COMPLETE SUCCESS!!!

As of this date a total of 556 written commitments have been secured, and late returns are still wandering in.

Some statistics: 1512 campaign information packets were mailed (1100 in the U.S., 412 internationally) to individuals and usergroups. This involved a total of about 12,000 individual xerox copies, 2000 envelopes, 4000 printed labels, and an estimated total expenditure of US$1650 by the Committee. The entire effort was financed out of the pockets of individual members of the Committee, all of whom are dedicated 8-bitters. Internationally, returns were received from the following countries: Australia, Canada, Czechoslovakia, France, Germany, Great Britain, Israel, Italy, Norway, The Netherlands, New Zealand, Romania, and Sweden.

The overall rate of returns was 37%; the return rate in the U.S. was 36%, and 37% for international respondents. All the information collected from the postcard returns has been compiled in a database in TurboFile format on an XL computer.

Not every 8-bit enthusiast was reached by the Campaign effort. Only about half the usergroups we had originally intended to send mailings to were actually contacted, and a number of individual requests for information packets were received after the official close of the Campaign and were turned away. The Committee regrets any disappointment caused by these unintended omissions and begs your understanding of the often chaotic conditions and limited resources available for the pursuit of this effort.

The Committee acknowledges with deep appreciation the following 8-bit vendors who supported our effort by running ads, forwarding lists of names, and distributing Campaign literature: BaPAUG Publishing, B&C ComputerVisions, Best Electronics, Computer Software Services, Current Notes Inc., Gralin Inter-

national, K.O. Distributors, and Unicorn Publications.

The Campaign Committe consisted of the following people:

Jeff McWilliams (USA), Campaign Manager
Ben Poehland (USA), Logistical Support
Mike Jewison (Canada), Distribution
Colin Hunt (England), Distribution U.K. and Europe
Dawn Scotting (New Zealand), Distribution
Dave Blears (Australia), Distribution

Its work now completed, the Committee is now disbanded. The comraderie shared between the various Committee members will remain a fond memory, and it is hoped the accomplishments of the Campaign Committee will stand as an example of what the 8-bit community can achieve when its members exercise initiative and pull together toward a common goal.

What's next? Jeff McWilliams and Ben Poehland are presently engaged in forging the sinews of what will- we hope- become ATARI CLASSICS. The intention is to take advantage of all the best features of other well-regarded periodicals (ANTIC, ANALOG, AIM, Current Notes, PSAN, etc.) while hopefully avoiding their mistakes. The subject content of the magazine will be taken from comments on the return cards and from discussions in public forums on the various telecommunications networks. All interested 8-bitters are encouraged to offer their opinions/suggestions, whether they participated in the Campaign or not. At this stage of things Jeff and Ben want to see as much diversity of opinion as the 8-bit community cares to offer. Communicate your ideas/suggestions to the Info-Atari8 newsgroup on INTERNET or the 8-bit Forum on Compuserve. You may also submit your ideas directly to: Jeff McWilliams, 2001G Woodmar Drive, Houghton MI 49931-1017 (INTERNET: jjmcwill@mtus5.mtu.edu) or to : Ben Poehland, 179 Sproul Rd./Rt. 352, Frazer PA 19355-1958 (GEnie: B.POEHLAND, INTERNET: poehland%phvax.dnet@smithkline.com). We shall not acknowledge individual communications, but be assured your ideas will be considered. We anticipate this phase should take about 4-6 weeks. Stay tuned for further announcements as we progress.

The number of returns recorded in this report will be taken as the official tally of Campaign returns. However, returns received after the release of this report will be accepted by Jeff McWilliams and duly logged into the Atari Classics Campaign database. So, if you are still in possession of an information kit and have not returned your card because you thought it was too late, please send it in! You will still be counted when we present our results to Unicorn Publications.

The Committee urges all interested parties to freely download/re-post/re-print/mail unaltered electronic or hardcopies of this Report. Permission is also hereby granted to publish this Report in unaltered form in any newsletter, magazine, or other print media. Tell your friends!

Finally, the Committee wishes to thank everyone who participated in the Campaign and returned their card. By so doing, you have cast your vote in favor of LIFE for your computer! LONG LIVE THE 8-BIT!!

(Signed), The Committee:

Jeff, Ben, Mike, Colin, Dawn, and Dave

1783. 130XE Keyboard Circuit Insert

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-03 04:05:40 UTC
From: jtb2@itri.bton.ac.uk
Message-ID: <1992May3.040540.11690@unix.brighton.ac.uk>
Source record: 111429

I used to own a 130XE, but after a couple of years the layer of plastic inside the keyboard on which the circuit is painted began to pick up corrosion on some of its tracks. For a couple of years I soldiered on, repainting tracks every couple of months. I even rang a guy at Atari UK, only to be told that this wasn't a spare part they stocked. Eventually I sold the system to a friend, who knew about the keyboard track repainting chore but who was desperate for access to some very old favourites such as MULE and Archon... Now, after abandoning the XE for his Amiga for a couple of years he's conceived a craving for MULE once more but those corroded tracks need the conductive paint treatment again and his hand is nowadays rather shaky from beating the hell out of Steel Fury to get into the first division on Speedball II and he can't paint a straight track. OK, the lager doesn't help either.

My request? Does anybody out there know where either an XE keyboard inlay can be obtained or an XE is being sold CHEAP for parts? Better still, would be some translations of certain Atari 8-bit games to Amiga or an 8-bit emulator with details for connecting up a drive (1020) to load the games from.

Advice from anywhere would be appreciated, although I suspect my friend is unlikely to put much effort into importing stuff into the UK without some arm-twisting.

Cheers.

1784. comp.sys.atari.8bit Frequently-Asked Questions

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-03 04:19:00 UTC
From: CURRENTM@CARLETON.EDU
Message-ID: <01GJJVOX255S90MUOJ@carleton.edu>
Source record: 111430

A lot of these Questions have been Frequently Asked again, so it must be time
to repost:

Frequently-Asked Questions

comp.sys.atari.8bit

Revised 18-Apr-92

additions/corrections/comments to Michael Current (currentm@carleton.edu)

What is comp.sys.atari.8bit?
comp.sys.atari.8bit is this Usenet newsgroup, dedicated to the free
exchange of information pertaining to the 8-bit Atari computers:
the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, and the XE Game System.
Users of Atari TT, STe, or ST computers refer to comp.sys.atari.st.
Users of Atari Portfolio computers refer to comp.sys.palmtops.
Users of Atari Lynx, 7800, 2600, or 5200 game systems see rec.games.video.

What is the Info-Atari8 Digest?
The Info-Atari8 Digest consists of postings to comp.sys.atari.8bit,
collected and e-mailed to subscribers on the Internet who do not have access
to Usenet. To subscribe or unsubscribe to the Info-Atari8 Digest, send
e-mail to Info-Atari8-Request@naucse.cse.nau.edu.
Cross-posting from the Info-Atari8 Digest to comp.sys.atari.8bit is not
implemented at this time. Thus, one should NOT post to
Info-Atari8@naucse.cse.nau.edu. Rather, one should send his/her posting to
comp-sys-atari-8bit@ucbvax.berkeley.edu to ensure that the message will appear
on comp.sys.atari.8bit.

What is the atari.archive?
atari.archive.umich.edu is the Internet site which contains many files for
the 8-bit Atari computers. The 8-bit Atari Archive Moderator is John Dunning,
jrd@stony-brook.scrc.symbolics.com.

How do I download files from the archive?
Two methods:
1. If you have FTP access you can FTP to atari.archive.umich.edu
(141.211.164.8), login as "anonymous" and type in your e-mail address as your
password. Now type "cd atari/8bit" to reach the 8-bit directories. If this is
your first visit to the archive, be sure to download the file -read-.-me-.
Other files of interest are 8-bit.cat, containing 1-line descriptions of all
the files available, and 8-bit.text, which contains paragaph-long descriptions.
Be sure to have file-type set to BINARY when downloading binary files (.arc,
.com, etc.)
2. Send mail to BART, the atari.archive file-server. BART's address is
atari@atari.archive.umich.edu. If you are a first-time BART user, send it a

message that says:

help
send 8bit/-read-.-me-
send 8bit/Index

BART automatically UUEncodes binary files before sending them to you.
Other files of interest are 8-bit.cat, containing 1-line descriptions of all
the files available, and 8-bit.text, which contains paragaph-long descriptions.

How do I upload files to the archive?
Three methods:
1. FTP to atari.archive.umich.edu (141.211.164.8), login as "anonymous",
type in your e-mail address as your password, and then type "cd
atari/8bit/new". You may upload files to this directory. Be sure to set
file-type to BINARY if uploading a binary file (.arc, .com, etc.) Also,
please upload a short .text file describing your upload so John Dunning can
tell what permanent directory to move it to.
2. Send your upload by e-mail to jrd@stony-brook.scrc.symbolics.com. If
you're sending a binary file you must UUEncode the file first. Be sure to
include a short descrption of the file at the top of the message so he knows
what directory to place it in at the archive.
3. If you can neither FTP to the archive nor e-mail to John Dunning, then
you are welcome to post your file, UUEncoded if binary, directly to
comp.sys.atari.8bit. You'll then be relying on someone else to take your
posting and upload it to the archive for you.

What is Z*Magazine?
Z*Magazine ("Z*Mag") is the International 8-Bit Atari Online Magazine,
published bi-weekly. It covers the 8-bit Atari computers exclusively.
Z*Mag is NOT the same thing as Z*Net, though they are published by some of the
same people.
To have Z*Mag delivered "right to your own mail box," send a message
to Ryan 'Gozar' Collins at rlcollins@miavx1.acs.muohio.edu, asking him to add
your address to his Z*Magazine Distribution List. Back issues of Z*Mag are
available at the atari.archive in the /atari/8bit/zmag directory, in filenames
such as zmag204.arc.
To reach the publishers of Z*Magazine, contact Ron Kovacs at
75300.1642@compuserve.com, or Jon Clarke at jonc@status.gen.nz.

What is the Cleveland Free-Net Atari SIG?
The Cleveland Free-Net Atari SIG is like a huge public bulletin board
system. Anyone can access the Free-Net via modem at (216) 368-3888. Those
persons with full Internet access can TELNET (this does not mean FTP) to
freenet-in-{a,b,c}.cwru.edu (129.22.8.{82,75,76}). Applications for accounts
are handled online. Once logged-in, type "go atari" to reach the Atari SIG.
Those who add their names to the Atari SIG members-list are automatically
members of the official Atari users' group CAIN - Central Atari Information
Network.
CAIN carries Z*Magazine and the Info-Atari8 Digest, as well as many
product reviews and all sorts of other information related to Atari products,
all online. Its mission for 8-bit users is as a depository for any and all

information in ASCII format related to the 8-bit Atari computers.

Are there any magazines still supporting the 8-bit Atari?
There are several:

Atari Explorer Atari Interface
Subscriptions Unicorn Publications
P.O. Box 6488 3487 Braeburn Circle
Duluth, MN 55806 Ann Arbor, MI 48108
$14.95/1 yr (6 issues) $18/1 yr (12 issues)

8-bit disk: add &17/1 yr (6 disks) tmailuk/c=gb/@sprint.com

Are there any product developers or vendors still supporting the 8-bit Atari?
Ben Poehland has created quite a long list of firms devoted to the 8-bit Atari market. This file is called vendlist.arc in the /atari/8bit directory of the atari.archive.
Ray Wilmott maintains a similar list. Contact him at wilmott@remus.rutgers.edu

What is an .arc file?
A file with the extender .arc has been archived, in a standard manner that is common in the IBM-PC/MS-DOS world. This is done to make the file shorter, so it takes less time to transfer between computers. The atari.archive contains an un-arc'er called supunarc.com for the 8-bit Atari. The companion program is called superarc.arc (use supunarc.com to un-arc it). Each is compatible with the MS-DOS equivalent.

What's this UUEncoding stuff all about?
UUEncode/UUdecode is a UNIX utility that will convert a binary file into 100% printable ASCII characters, so that the file may be posted or e-mailed anywhere a text message can go. The 8-bit Atari is perfectly capable of UUEncoding/UUdecoding as well. The file uudecode.bas (the documention file is uudecode.doc) is at the atari.archive. It's in Atari BASIC text format (ENTER it into Atari BASIC). The file yau.arc contains yau.com, a machine-language UUdecoder, and yaue.com, a UUEncoder for the 8-bit Atari. Each is compatible with the UNIX equivalent. UUEncoded files are given the extension .uue.

Can I read/write 8-bit Atari disks on an IBM-PC?
Yes! There are three files at atari.archive that claim to do this. They are: atario21.arc, pcxfer.arc, and util.arc. Each of these programs runs on an MS-DOS type of computer. For disks written on your PC to be read on your 8-bit Atari, you must have an Atari disk drive capable of accessing at least 180K, SS/DD disks. That is, an XF551, Indus GT or equivalents, but not an unmodified 1050 or 810. There is no way to write 128K or 90K Atari-format disks with an IBM-PC. You will also need either SpartaDOS or MYDOS on the Atari.

What's the best DOS for the Atari?
This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system. MYDOS is an extension of Atari DOS 2.0S/2.5 that provides subdirectory and hard-drive support. SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2D is disk-based; SpartaDOS X is cartridge-based and includes many additional features. While it's hard to argue that SpartaDOS X is not the most advanced DOS available, it is a commercial product that is no longer manufactured. MYDOS, on the other hand, is a shareware product that continues to be improved upon. It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. MYDOS is available at the atari.archive.

What are the best telecommunications programs available for the 8-bit Atari?
It all depends on what type of computer you intend to connect to. For connecting to Bulletin Board Systems, BobTerm is the unchallenged favorite. For connecting to larger computers, you will need a VT100 emulator. Several are available for the 8-bit Atari, each with its own advantages. Kermit-65 is a VT100 emulator, provides Kermit file transfer and an 80-column screen display, but does not support the XEP80. VT850 is a VT100 emulator that supports the XEP80 but provides no file-transfer. OmniCom is a VT100 emulator providing both kermit and xmodem file transfers, plus an 80-column display, but does not support the XEP80. Each of these programs is known to work with the SX212 Modem connected to the SIO port, and to work under SpartaDOS and MYDOS; each program is available at the atari.archive.

1785. Higher-res APAC modes.

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-03 04:59:21 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <mDm7JB1w164w@cyberden.uucp>
Source record: 111431

(Jeff, I hope you're reading this! :))

I'd like to see both a 16 color 160x192 mode (sorta like how it was done in ColrView, but more like APAC) and a pseudo 640 mode (again, done like APAC). The 640 mode would be hellish, but much clearer for things like 80 column than the normal 320 mode. (yikes!) What >I< was thinking was having two screens (here comes the death of 16k!) Both would have black backgrounds, and one would have a white, the other a grey foreground. IF you wanted, say, to draw a circle, it would be like this: (spaces are black, "+"s are grey, and "*"s are white)

```
 +**+
 +*****+
 ******
 ******
 +*****+
 +**+
```

hmm! That even LOOKS a lot like a circle (then again, I'm using 40 column, so for most of you folks, it'd look like an oval, but you get the point, don't you?).

Well now. Isn't that special??
Here's a neat way to really smack the 320 mode 80 column screen in the face. Have character sets (this SHOULDN't be too difficult to switch into my above mode...) with only the left (or right!) nybbles filled with character (just like done in the graphcis style), but THEN, using another screen for the opposite nybble (and not even a seperate character set, just set the scroll register over 2 color-clocks (4 high-rez nybbles), switch between the two at high speeds (oh! page flipping!) I might even start work on a little ML routine that'll do it right tonight! (and probably crash my computer, and if I'm lucky, accidentally call the "format drive" routine! hahaha!)

Well.. are any of you major hackers out there interested in creating a mode like this (these)?? I'd really like to see that 80 column mode!! (hmm...mabye I'll also forward this to Bob Puff! hahha! ("hey Bob! (hint hint)"))

well, lateron Atari-dudes

Hey! Yeah.. Probably. In BASIC a few times I decided to copy the
SIN/COS table for use in drawing circles and the such. It IS much
quicker, and if done correctly, shouldn't take up TOO much more memory
(tho the "resolution" is lost..)

I'd like to see something use a math-coprocessor, tho! :)

This is the official Press Release regarding the merger of Z*Net and
Atari Explorer forming Atari Explorer Online Magazine. The first issue
will debut May 1, 1992.

FOR IMMEDIATE RELEASE-

Contact:

John Jainschigg 718-545-2900 GEnie: EXPLORER CIS:76704,1616
Ron Kovacs 908-968-2024 GEnie: Z-NET CIS:75300,1642
Bob Brodie 408-745-2052 GEnie: BOB-BRODIE CIS:70007,3240

April 24, 1992 - Atari Explorer Announces New Online Magazine!

Sunnyvale, CA.- Atari Corporation and Rovac Industries are proud to
announce a brand new online magazine for the Atari Community: Atari
Explorer Online. Atari Explorer Magazine, the Official Atari Journal,
is now extending its coverage of all things Atari to the online scene,
as well. The first issue of the Explorer Online is set for May 1, 1992,
and the magazine will appear biweekly, thereafter.

"Explorer Online will team up some of the finest journalists in
the Atari Community!" said John Jainschigg, Publisher. "We're excited
to be able to offer such a quality product to our many customers. The
goal of Explorer Online will be to serve the needs of all Atari
users: Portfolio, Lynx, ST/TT, and 8 bit. All of Explorer's regular
contributors will be represented in Explorer Online: from music experts
like Craig Anderton, to Portfolio Wizards like BJ Gleason. And we are
actively soliciting contributions, both to the online magazine, and to
our regular, bimonthly print edition. We want to make Explorer Online
a solid resource for the whole Atari community."

Atari has teamed up with Ron Kovacs, publisher of the Z*Net Newswire
and Z*Net Online Magazines, to produce Atari Explorer Online. "When
we decided that we wanted to do an online magazine, it just didn't
make sense to completely re-invent the wheel," stated Bob Brodie, Atari's
Director of Communications. "In the online Atari community, Z*Net has
set the standard for quality and accurate reporting, and it only made
sense to invite them to participate in this new venture. Ron Kovacs and
John Nagy are among the finest, most dedicated journalists on the Atari
scene today. The entire Z*Net staff will be part of the new team at
Atari Explorer Online. We're very excited that they have chosen to join
us in making Explorer Online the best it can be."

The start of Atari Explorer Online also signals the end of the Z*Net
Online magazine for the Atari ST Community. Current plans call for
Kovacs' firm, Rovac Industries, to continue to publish their popular

Z*Net PC, and Z*Magazine publications. "While there is a certain sense of loss with Z*Net discontinuing, we're very excited that Atari has invited us to be a part of this exciting new venture" said Ron Kovacs, Editor-in-Chief of Atari Explorer Online. "Atari Explorer is one of the finest magazines on the market, and it's very flattering to our efforts that Atari has chosen us to help them with their online magazine."

"When Explorer Publisher John Jainschigg came to me with an idea for a new online magazine, there was no question that we were going to need some outside help. And it was an easy choice to decide where that help should come from. Week in, week out, Z*Net has provided the latest news to the Atari Community for years. Indeed, Z*Net has experienced growth over the years. They have the experience in launching new online publications, like the original ST-Report, ST*ZMagazine, and Z*Net PC. Additionally Z*Net's Atari News Service has appeared in print publications world-wide including: STart Magazine, ST-World Magazine, ST-Informer, ST-Journal, ST-Express, AtariUser, Current Notes, and Germany's PD Journal now Atari Journal. It really just made sense from every side that we considered to ask them to be involved," stated Brodie."

AEO will be distributed worldwide on major information services and networks. Atari Explorer Online will carry up-to-the-minute reports on hot topics in the Atari market: from trade shows to new product announcements. Explorer Online will give you the facts you need to make the most of your Atari investment. Utilities and Atari PD releases, new product demos, product and dealer databases, and other interactive offerings will round out the publication, making Atari Explorer Online the best in online journalism today!!

We have the premiere issue of Atari Explorer Online on the Cleveland Free-Net
Atari SIG. There is exactly zero mention of the 8-bits - even in
describing the coverage of the printed Atari Explorer.

Well, you can only put in so many points for a look-up table.
When you are talking about a vector based program, where you need to
draw objects like arcs, circles, ellipses, and parts of circles and
ellipses, say draw an ellipse but only from PI/2 to .88231 PI you
NEED to have an accurate calculation of TRIG functions. Then what
if you want to rotate an object about a fixed point?
And if you want the output to be scalable and accurate, you
start with a virtual page that has say, 3000 DPI, and depending
upon the printer you need to print it to, scale it down
to 300 DPI for a laser, 180 DPI for a 24 pin printer, whatever.

Unless you use up ALOT of RAM for lookup tables accurate to
8 decimal points.. .it's better off waiting a little while longer for
the FP routines to do their stuff... and improve the speed of the FP
routines.

Doing a Math COprocessor is tempting... but I know nothing about such
beasts. Say you wanted to use a 68881. Will it talk properly to
a 65802 or 65816? Or will the CPU need to be upgraded to a 68000?
Then you are talking about knowing how to code an entirely different
processor. And Math CO's are not cheap. 68881 are somewhere around
$100.00 plus figure in the cost of the other components, the 68000,

RAM, EPROM, the board, glue chips... who's gonna pay for such a hardware product, or even build it from scratch?

Does anyone see my point here... the benefits of having a 68881 are many... but with those some other complications. Hence my desire for a simpler, cheaper design.

I appreciate all this input. It has given me ideas and a notion that what I build may probably end up being only for myself and maybe an interested special friend or two.

Jeff McWilliams

The character set only uses 8 bytes per character, but all the lower case
characters are shifted down a line in the display. I'm not sure, but the
bottom line of the descender might be stored in what would normally be the
top line of the character. Oh, and I don't think Textpro normally uses this
graphic mode. It looks a lot like Speedscript, but I believe it uses the
normal 24-line screen (with a DLI for the top line).

1793. hand-print recognition...

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-04 23:35:01 UTC
From: spam@iastate.edu
Message-ID: <1992May4.233501.12384@news.iastate.edu>
Source record: 111439

Hi ho...as a waste-the-summer-away project, I'm considering implementing a handprint recognition system. Once upon a time (2 months ago) I assumed that this was one of those deep-magic things that no one really understood, but after reading a couple articles (notably one in April's Dr. Dobb's) I think I have a basic understanding of how a handprint recognition system could work.

However, the only handprint interface I have is the koala pad, so I figured I'd do at least part of it on my atari. I'm not sure i could reasonably do it all on the atari, because the only language I have available is basic. So I considered using the atari as a digitizer and spitting the image out a serial port to my unix box, which would do the actual crunching.

Does anyone have any interest in this project? This would be more a "can it be done" project than an actually useful piece of software. I doubt it could reliably replace the keyboard driver, for example....

Anyway, I just thought I'd mention my intentions to see if there's any interest.

sorry to take sio long to reply, but I was kind'a hoping someone else would take it on. Since you have 'Mapp'n you know the lines. What you want to do is decode the address lines with a 74LS521 or 74LS688 such that the compare goes 'true when the address is anywhere in an unused page. $D700 to $D7FF if you only use one '688 is fine, but you should be able to cascade two '688s so you could decode the entire 16 bit address bus if you want to add more then one chip. Now you tie the 688's output pin to the "NOT CS" pin of whatever LSI device you're using (it'll have a line over it to signify NOT). All other chip select lines are tied to +5 or gnd to make the 688 the only thing needed to get the chip on. Next you tie the chips register select lines to the lowest address lines. "Most" devices have from 4 to 16 on board registers designated RS0 or something like that & need 2 to 4 of the lower address lines attached to the chip to select them. Ignore the other lines for a one '688 design. Next tie the latched R/!W line to the chip's R/!W line & connect the 8 data lines. That's it unless you want to make a "True" parallel bus device which would require it's own ROM & someone much smarter then me <grin>. Now any R/W to the $D700 area will enable the chip. 'Should work with everything from 6520's to disk controllers etc. I'd suggest getting an old Apple prototyping/WW card, I just found one for about $10 & a 50 pin edge card connector. Solder the edge card to the proto card fingers & it'll plug into the expansion bus.
Your welcome
Rick

Jeff, I'd NEVER want to discourage you from doing anything with an 8-bit, but if something is only done to the screen you can go through a few girations an keep everything as int's. What you do is scale all calculations such that they are on scale i.e. sin(45 degs)=.707 becomes sin(45)=707 then you calculate the screen position. Since we only have 192X320 the rez is good enough. I'm NOT saying you'd want a spread sheet that'd use this method, but for simple stuff that only needs 1 part in 320 it's good enough. Since you're working with ints, you get one part in 64000. I'll see if I can get off it & send you some Action! code that demonstrates the technique. I've even seen a number of M/L games that use look up tables like this to determine the acceleration due to gravity. Whoops! (again) I may have miss spoke! The result can be accurate to 1 part in 64,000 BUT you can't have 64,000 discrete angles with the resulting 64,000 int answers. Unless of course you've got a 256K+ computer. It'd be a good article to start off the Classic Mag if you get something hung on the bus!

well, I hate to break it to you, but the atari 8bits use a relatively
nonstandard floating point format. it uses 6 bytes to store 10 BCD
digits and the exponent. Most other computers (including 68000)
use IEEE format, which uses a binary mantissa (not BCD). so a
68881 would require a major reworking of the OS at the very least.
It might be possible that all you'd need to do is rewrite the
conversion routines (FP <-> int, FP <-> ASCII).

>Does anyone see my point here... the benefits of having a 68881
>are many... but with those some other complications. Hence my
>desire for a simpler, cheaper design.

I like the idea of using a 6502 at a faster clock. Maybe use
a spare 600xl or 800xl, stuff in a faster crystal and disable
the video stuff. I'm sure it wouldn't be simple, but it
could be worth it.

FWIW, I designed a floating point chip this semester for a
VLSI design class. I was very tempted to make it use Atari's
format, but the instructor wanted IEEE. Oh well.

Does anyone know how fast(ly?) the POKEY chip converts analog paddle (pot)
states to digital values? I presume it's pretty slow.

Thanks in advance,
Anders Skelander

1799. MIO Cables

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-05 14:22:00 UTC
From: UJ1G@DKAUNI2.BITNET
Message-ID: <"92-05-05-07:22:15.72*UJ1G"@DKAUNI2.BITNET>
Source record: 111446

Recently I talked to an "expert" on our university on the issue of
MIO cables. He owns an Amiga and he have had exactly the same problems
with signals breaking down while using long data/address/control cables.
He hadn't been able to use cords longer than some 25cm (10").
Now he is able to transmit data over a distance of 2m (80"?, 3 ft + sth)
He has managed this by redesigning his flat ribbon cable. Between each
two data/control/address lines there _must_ be a line connected
to ground (0V). This measure prevents the signal from flashing over
to adjacent lines, which is especially true with long cables.
The MIO cables don't seem to have additional GND lines inbetween each
two signal lines. That way they aren't designed for long distance
connection.
I admit that it is hard to build a cable described above because as a
matter of fact you'll need at least some 20 additional lines just
connected to GND (monster cable if you are using a flat one).

I think it is at least an interesting idea worth considering.
It works great on an Amiga.

BTW: the guy I asked doesn't think the idea of adding buffers to
lines would help.

They are only updated 60 times/second in the normal mode, but the actual time they take to do the conversion is is during the screen display, so that makes it about 1/180 of a second for a full scale conversion. There's also a fastscan/potgo setup in Pokey to allow you to read the pot value in one scan line (which I've never used) so approximately 1/180*192 seems like it might be right. It's just fast enough to digitize audio, but it'll never replace CD's.

Hmmm. Interesting. Now if the people I ordered my Action! cart from
and the Action! toolkit from would only send me the stuff!
But unfortunately I am not only talking about doing this stuff to the
screen.
The Screen only represents a lo-rez look at a printed page, at
180 DPI or greater. No matter what the resolution of the device, the
images are scaled and drawn appropriately to that device, which means
the output could go to the screen, 24 pin printer, 9 pin printer,

Contact Best Electronics at 2021 The Alamede Suite 290, San Jose,
California (USA), 95126, or call them at 408-243-6950.

They have the 130XE Mylar keyboard insert for around $20, I think.
Or, you can probably order a whole new keyboard for around $25-30.

Also, I've seen somewhere a liquid that is like metal paint, that can
be used to repair those circuits. It's used primary for repairing
stuff like the rear-window defrosters in cars, but it's the same
idea.

Currently, there is no 8-bit Atari emulator for the Amiga. There is
one for the ST, but it's far too slow to play MULE on, and doesn't
support Player/Missile graphics.

Hope this helps.

Hmm.. that is not a bad idea either. The problem is the Atari XL/XE computers don't use a standard 6502, Atari added some buffers to it. And I am not sure the 6502 that is in there could handle a faster clock speed. Then again I am only basing that on an assumption, no hard facts. But if you did have to replace the 6502, you would have to externally add the buffers Atari put in their version, the 6502C.

Designed a MathCO in VLSI design huh? Pretty impressive.

If you read the shadow locations starting at 624, they are updated every 1/60th of a second. The actual pots themselves, normally, are syncronized to the display as it displays each row. So, if you wanted to read the hardware registers directly at 53760, to get a value of 200, you would at least have to wait for 200 scan lines to be drawn on the screen before you had a valid value in the hardware registers.

Here's how it works: poke a vlue at 53771, then later read the values starting at 53760. This would only work if you disabled the vertical blank interrupt. This at best, would give you a read rate of 120 reads/second.

Or.. there is a faster scanning technique that can be read 7990 times per second. This is how parrot works to digitize sound. Poke 53775 w/0, then again with 4. Then read locations at 53771 after the time it takes 2 scanlines to be drawn.

Just for the record, there ARE "fast" ways of generating SIN() and COS() and other trig, transcendental, etc. functions. (Surely you don't think a pocket calculator has more firepower in it than an Atari... I don't... does anyone know for sure?) I've heard rumors that HP calculators use something called "CORDIC rotators," which converge to the right answer at something like "one bit per iteration" of accuracy.

If anybody here happens to know, or look up, or otherwise unearth, information detailing these CORDIC beasties, I'd like to know more about them.

>chip, and is the prototype for the 65XE. A number of these beasts were
>released within the UK).

One simple question: What is the Freddie Chip?

I have read about the 130xe and have one myself, and know that they use
a Freddie chip to control the memory. I know alot about chips, ttl and cmos
from my Computer Hardware course. I have looked through several electronic
source books and have never run across this chip. If someone can post
what it does and possibly where one can pick one up at, please do so.
If my hunch is right, it merely controls the bank switching and chip-selects
of the rams and possibly the refresh cycle too...
Most upgrade merely use an Address decoder to control the bank switching.

Sounds like a good hardware upgrade for the ol' 8-bit. But all my graphics
programs (APACVIEW et.al.) don't use floating point. Would it be possible
to route subroutines to the coprocessor to take advantage of its 8 MHz
operation (plus no interrupts for DRAM and screen refresh)? If so, I could
make a screamer of a GIF decoder, Bob Puff could speed up his UnArc, etc.

Hmmmmm.... I remember thinking of this mode, then conciously not
implementing it. It sure means you gotta wait a long time if you're
decoding an interlace mode picture, and you just want to see some detail in
the upper left corner...APACVIEW has to scan the whole file three times.
Maybe I was just too lazy at the time (that interlace mode-when GIFs decode
in four passes and filling in between previous lines-makes a lot of nifty
features darn near impossible to code) (This has nothing to do with .ILC
or interlaced APAC pictures). Anyway, three files means you can create
them yourself from other graphics 9 or 15 drawing programs, etc. James
Pittman did create his own ColrView paint program (works only on expanded
(256K) 130XE's, available on CI$).

|> unobvious to my meager mind!??! :))

Hmmm....I had written a really good response to this post, but my mailer
must have digested it. No real good reason why I never created a mode like
this. It does mean you'd have to wait for the GIF image to load three times
entirely before it would save. The .R/G/B format was also chosen to allow
others to create their own graphics 9 or 15 files for viewing with COLRVIEW.
I believe it was James Pittman who created his own COLRVIEW painting program
(only works on 256K 130XE's, available on CI$).

There was a bunch a nifty features I could have included had it not been for
the Interlaced GIF mode (where the loading takes four passes, each pass
filling in detail between the others). This mode makes variable magnification
a royal pain to code!

MIO stands for Multi Input/Output and has several functions.
Ramdisk (up to size of ram 256k or 1meg)
Printer buffer (up to ram size)
Printer interface
RS232 interface (modem)
HD interface (SCSI 256 bytes per sector only)
Device swapper (floppy can be on drive 1 on its switch and the MIO
will treat it as drive 2-8 allowing you to boot from
ramdisk)

Some of the advantages are that the MIO has its own power supply and can be booted from very quickly. Ram disk info is not lost when the computer is reset or turned off...unless the MIO is powered down.
There was to be an 80 col video adapter built into later models, but the ROM chips for driving the port were never released.
All in all a neat device.

>
> Keith

You are lucky, at least on the S.A.M. issue. Like many other German
commercial and non commercial software S.A.M. is entirely in English.
Actually there isn't even a German version available.
English has a great impact on German software production. In Germany
you find more programs that are in English than in German
(we are talking about programs written by German authors!).
Many people here in Germany don't like this, they want to have more
German speaking programs but there is no way of getting English
out of German programs :-).
Anyways, the docs for S.A.M. are in German. :-(
You are out of luck according to english-language versions of
"AtariMagazin" they are only in German (still published after a
break!).

Yes, there is some commercial software here in Germany produced
by dedicated users and small companies. Take "Quick" for example
which is a commercial compiler language a little bit like
"C" and "Action!" and like "Assembler". It is very fast.
You can even write procedures for the VBI. This language supports
a ST-mouse, digitized sound, P/M graphics and lots more.

I hope this gave you a vague idea about the situation in Germany.

See ya,

Well, if your Action! pack ever gets to you, the Toolkit has demos for accessing the FP routines. It's not obvious or easy, unless you're used to calling the routines from M/L, but they're usable. I've only done one Action! program that used them (just a simple translation of Point Set Graphics from one of Compute's [1st?, 3rd?] book of the Atari). It produces a very noticible speed increase. BTW: I've got an EPROM burner if you get as far as that for a co-processor. I'm still in favor of 6551 links between the microprocessors, but if somebody gets stumped for lack of a burner I'll offer my services.

It's probably not the answer you're looking for, but close. Jerry Edwards at Agnew Hospital in CA has been using 8-bits to hook paraplegics up to the outside world so to speak. Even though I've talked with him, he doesn't say much about his work, modesty I believe. From what I've heard he's found some people who were thought to be severely brain damaged that have relatively normal IQs. I could get more details, but I think he's using the persons head movements as input. I'm not sure about the need for hand writting analysis, but there is a definate need for communication with people that have no control over their body or voice.

I've been asking in rec.games.video about the game Haunted House for the 2600. It sounds as if it's an interesting old game, but the guys who responded to me didn't think it was ever made available for the Atari 800/XL/XE.

Is there anyone out there who has heard of an Atari computer version of Haunted House?

1824. Atari User Group meeting - Wed May 13/92

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-06 15:47:28 UTC
From: daroloso@math.waterloo.edu
Message-ID: <1992May6.154728.13018@math.waterloo.edu>
Source record: 111371
Cross-posted to: ont.micro,kw.micro,comp.sys.atari.8bit,comp.sys.atari.st,uw.sys.atari

In May, the Kitchener-Waterloo Eight Sixteen Thirty-two (KWEST)
Atari user group will have a general meeting with the spotlight on
Desktop Animation.

Our 16-bit library currently has over 400 disks of public domain
and shareware software.
In addition, there will be our updated catalog disk and our
disk-of-the-month.
Our 8-bit library is also available at this meeting.

As well as our own newsletter "The Hard Copy", we will also give
attendees the May issue of AtariUser.

The group welcomes new members and visitors with
8-bits, 16-bits, or those just curious.

Meetings held at the University of Waterloo in the
Math & Computer Building.

Room opens at 7:00 pm. Meeting starts at 7:30 pm.

Wednesday, May 13, 1992
DCS Course Room, Room 2009 (2nd floor)

Call 579-3695 for more information.

Hope to see you there,
Dani Roloson

> copy they'd get me?? or was it someone else??????)
> later-on Bill

I've seen this other SAM on a C=64 too, but it's a different S.A.M.
I'm gonna explain to Bill and all other interested people.

S.A.M. stands for Screen Aided Menagement. It is a piece of commercial
software produced by a small German software house.
It is a user interface with integrated applications.
It uses an 80 columns screen on a standard TV set. It looks a little
bit like GEM on the Atari-ST. You have pull down menus on the top
of the screen where you can select items with your mouse or joystick.
There are standard items like "directory, lock file, format disk,
read sector, duplicate disk, etc.". Then you have some special
applications you can pick up. They will be loaded from the S.A.M. disk.
One of them is a spreadsheet program. Another is a program called
"Memobox". It is a small database with the possibility of creating
your own data cards. Also included are two character editors.
One for standard B/W characters and the other one for GRAPHICS 12
color character sets. Next application is a painting program
which uses 128 colors but only 4 on a single line (standard DLI).
It has many usefull functions like fill and unfill!, draw lines, draw
circles, mirror etc.
Another part of S.A.M. is a word processor. It has all the functions
I need like text formatting, cut, paste, block text, preview function
(you see the whole layout of the page), support for Atari printers
and Epson printers.
Next item you can open is a monitor program to browse the memory.
It has some kinds of display functions like showing screen code
or ATASCII code or showing bytes in their binary appearence
(eg. $A800: 01011100) so you can easily scan for character sets.

I think I have described all the implemented applications.
All of them have full 80 column and mouse support. But there is more.
S.A.M. is a kind of extention of the operating system. There are
documented interfaces for routines of S.A.M. so you can write
your own software. For example you can use the "open window" routine
just by putting the coordinates in a special location and calling

the apropriate S.A.M. subroutine. Then just give your application
a special filename extension and place it on the S.A.M. disk.
Next time you use S.A.M. your application will be awailable in the
pull down window.

Due to this flexibility there are some new programs for S.A.M.
awailable. To name one: a 'Breakout' game.

Ok, I think that's all I remember about S.A.M.
I hope this gives you a vague idea about it.

>as the 1st generation ones.

True. But location 53279 (decimal) isn't in ROM, it's an address in
a chip, probably POKEY. ROM locations never have a "write use" in
the Atari.

I'm curious about this location. Does clicks caused by writing
address 53279 affect the four sound channels in POKEY, or are
they independent of it?

HH was an interesting game; but not as much fun as adventure. You were a
pair of eyes (like eaten pac man ghosts) that went around a house, scolling
up and down each floor, with a stairway to get up or down. There were bad
guys, like ghosts, bats, etc. You could see objects around you by pushing
the joystick button to light a match, but it would blow out or burn out
eventually; you had to conserve. Can't remember all the objects you
could pick up, but the idea was to find three pieces to a chalice or something
and take it to the exit of the house. It then played the theme to the
Twilight ZOne (used without permission)

It's completely separate. If you have a 400 or 800, the clicks come from a speaker inside the computer, not from the TV or monitor speaker. And if I remember right, that location (53279) is in the GTIA chip.

From: Jeff McWilliams <JJMCWILL@MTUS5.BITNET>
Message-ID: <92129.010850JJMCWILL@MTUS5.BITNET>
Source record: 111384

I am having some problems with paperclip 2.1 which I just purchased used. First, I was highly dismayed when I booted it on my 1088K Newell upgraded 800XL and it failed to recognize it as a 130XE compatible machine. All other software that I have run on this machine has worked fine as far as 130XE compatibility goes.

Next, I dug up my Newell 256K 1200XL and booted it into Paperclip 2.1 with BASIC removed of course. This time is recognized it as a 128K machine and reported 80K available as text RAM. I thought I understood Paperclip can recognize up to 220K for use as a Text buffer? Can someone help me on either or both of these problems? Amos Jackson, you have a 1 meg Newell computer, have you ever experienced these problems before?

If I could get Paperclip to recognize more memory, I would be prepared to make it my main word processor, as it has lots of bells and whistles.

But these problems have me seriously perplexed.

Going on about recognition of hand writing. Well, 1) does the Koala have good enuf resolution to get handwriting? (I've never used an Atari koala, just a c=64 and I was VERY VERY young at the time!). This is MAINLY because I write VERY VERY tiny (not THAT tiny, but just very squished together).

Back to the ability to do this.. well, this is more of an artificial intelligence type thing than anything else. (>>IF<< you want the thing to learn handwriting). You'd have to have it perfect the writing as you go on, until it can easily tell how you normally write. I was watching an episode of that cool PBS program "The Thinking Machine" (is that what it's called? well, anyways...). The episode was about AI (you all saw that coming, didn't you!? :)). This group was just teaching a machine...FACTS, sorta like reading it an encyclopedia, but going a bit farther, into the "common" knowledge that WE all know, but the computer doesn't. (IE, when George Washington was in Virginia, his left foot was in Virginia...)

Anyways. From seeing that and playing a bit with an inference engine (you say "a bear is a mammal. a mammal is an animal. what is a bear?" and it'd reply "mammal/animal"..etc.etc.), I could understand the simplicity of a handwriting "translator" or whatever you'd like to call it. Oh well, enuf useless babble. Have fun with the project.
Perhaps one day you could TRANSLATE it from whatever you're using on your Unix to Atari BASIC! :) heheheh.. later

HMM!??!? Either I'm totally lost, or you didn't understand the question.
The question was rather than making three CV files (.r,.g & .b), just
have 1 BIG file containing all colors in succession. Or! Either I have
an old version of CV, or you were lying about zooming into pics. in
colrview!! (ya said "the upper left corner"). All I want to do is use
the "A"ppend command when saving for more than just .ILC/.PZM file
creating. Ah well.. just confused (or confusING!?)

Nope, it didn't get eaten. Umm.. I THINK I understand a LITTLE bit
better now.??? Doesn't the GIF load 3 times when you make a ColrView
picture ANYWAYS!? <grin>. All this "mode" is is a loading mode, not a
graphics mode. Your loader wouldn't be like this:

```
LOAD NAME.R
LOAD NAME.B
LOAD NAME.G
```

```
it'd just be
LOAD NAME
LOAD IT SOME MORE
LOAD IT SOME MORE
```

This uses just 1 file bing 62x3 sectors long. Also, this'd let you use
extenders on file names, rather than NEEDING the ".R",
etc.etc.etc. later again Phbill

ZAP ZAP ZAP OUCH!
I'm sorry. I've just totalled MANY A DISK with sparta dos. IE:
I got BobTerm 1.22, it's 197 sectors. So is 1.21. I went to copy 1.22
over 1.21. It ran out of room. In the first place, the FREE didn't add
onto the total sectors correctly either (file1's length+file2's
length+etc+etc+FREE SECTORS was NOT = to 1027 like it WAS BEFORE I LET
SPARTA TOUCH IT! :))...
anyways.. remember, there are good computers with
good software <and> bad software.... and then there are just BAD
computers! :) I'm glad I don't have an -----2! ;)

Sorry 2 offend you!! I was just mad at the damned thing! I've used my
Atari for 9 years now and have had very few complaints except when it
comes to disks dying on me for mysterious reasons. (usually my fault,
but this time I don't think even >I< could mess up enuf by myself to get
30 sectors to "dissappear" yet still be on the "free" part of a disk!!!
heheh) later - Bill

1852. need help with Paperclip!

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-08 14:21:45 UTC
From: Jeff McWilliams <JJMCWILL@MTUS5.BITNET>
Message-ID: <92129.092145JJMCWILL@MTUS5.BITNET>
Source record: 111399

I am having some problems with paperclip 2.1 which I just purchased used. First, I was highly dismayed when I booted it on my 1088K Newell upgraded 800XL and it failed to recognize it as a 130XE compatible machine. All other software that I have run on this machine has worked fine as far as 130XE compatibility goes.

Next, I dug up my Newell 256K 1200XL and booted it into Paperclip 2.1 with BASIC removed of course. This time is recognized it as a 128K machine and reported 80K available as text RAM. I thought I understood Paperclip can recognize up to 220K for use as a Text buffer? Can someone help me on either or both of these problems? Amos Jackson, you have a 1 meg Newell computer, have you ever experienced these problems before?

If I could get Paperclip to recognize more memory, I would be prepared to make it my main word processor, as it has lots of bells and whistles.

But these problems have me seriously perplexed.

Jeff McWilliams

I don't recall what the resolution of the koala pad is, but it's plenty large for my purposes. If I can scratch an inch-high "A" on the pad and have the computer identify it, then I'll be happy. This isn't going to be very useful in the real-world because of the hardware involved (IMHO any useful hand-printing-based system must be completely portable). I'm more interested in the neatness of the project.

The algorithm I'm planning to use is based on one described in the April issue of Dr. Dobbes Journal. It's far easier to do than I'd ever thought; I don't see any trouble in using the Atari for this project. Not much number crunching is involved, and I wouldn't even call it artificial intelligence. However, for at least the initial implementation I plan to use a unix system to do the analysis so the software will be more portable. The atari will be little more than a digitizing pad. Later, I may start to move some or all of the analysis services over to the atari.

Well, I wouldn't call it simplicity...but I might call it "simpler than I thought". Actually this is one of those examples where the difficulty lies more in having a correct "vision" of the solution than in the actual implementation. I suggest that anyone interested in this sort of project get the april issue of Dr. Dobbs journal...

From: bmarcum@world.std.com
Message-ID: <BnyK5r.92F@world.std.com>
Source record: 111403

The only problem I can see with using one big file instead of three little files for Colrview is, you might run out of disk space while saving the second or third image. If it was all one file, you would have to start all over again. Also, with some gif files the R, G, and B images turn out to be exactly the same anyway (The gif is encoded as 16 or 256 colors, but they're all shades of gray). I think it would be nice if Apacview made it easier to save the R, G and B files. You reload the Gif file by pressing Option and then trigger instead of retyping the file name, why not do something similar to save a file?

Bill Marcum

You can set it for two speeds: once every frame (60 Hz) or once every two
scan lines (about 7850 Hz). You do the latter by setting bit 2 of 53775
($D20F; SKCTL/SKSTAT) to 1. It loses a little accuracy at this speed,
however.

1862. SpartaDOS X and Databases

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-09 17:50:00 UTC
From: Amos.Jackson@f47.n282.z1.tdkt.kksys.com
Message-ID: <705460060.F00001@tdkt.kksys.com>
Source record: 111309

Well, when I was first introduced to SpartaDOS (before I got an MIO), the person gave me a few disks with it and various command modules on it - but NO docs!!

Took me a total of 4 hours to learn how to work it inside and out. Of course I ALWAYS create a copy of my working disk (the only real rule to computing!) before doing any overwriting to any files (yep, you guessed it - I learned that one the HARD way!) to insure that if something goes wrong, I still have my original working disk. I7ve never experienced free space disappearing as you mentioned except when XINITing the first partition of the hard drive set up (something that I've done a few times). Really, that's the only complaint I have with SpartaDOS, and even with that, it's not the DOS itself, but the floppy formatter. I feel that a safety could have been placed in the code to check to see if the drive being accessed is not a hard drive, for it tends to get a user EXTREAMLY upset to see a 7.5 meg partition turned into a 720 sector disk!! :-(

Anyway, thanks for understanding my post and for aiding the net in the mannar that you do.

1863. SpartaDOS X and Databases

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-09 17:56:01 UTC
From: Amos.Jackson@f47.n282.z1.tdkt.kksys.com
Message-ID: <705460060.F00002@tdkt.kksys.com>
Source record: 111310

BTW: You didn't mention which version of SpartaDOS you were using at the time. I do know that version 3.2d is the most unfriendly version as far as getting certain file to run with it, X 4.20 is the best. I've had to use a little known command with 3.2d called XDIV (internal) to get certain files to run. It's some sort of multi-mode/multiprocessing command that SpartaDOS uses that can be turned on and off (ICD called it multitasking, but I'm sure that it isn't TRUE multitasking).

Source record: 111311

Even though I'm not sure how it's done, there is something simillar that occurs in BBS Express PRO through the file area commands. Although it is in the standard text mode, what happens is on the SysOp's side of the bbs (at the bbs itself), there is a chart that comes up when the file transfer takes place. The chart is generated from the middle of the screen, outwards. The first time I saw it, I was astounded. The operation is VERY fast (equal to 19.2k baud), but with the press of certain keys, it can be slowed down. When the file transfer is complete, the reverse happens - the screen flashes, and the chart shrinks back to the center of the screen and there is text "behind" the chart informing the SysOp how many files, descriptions were sent/entered and if any file transfers were aborted. This operation takes place at m/l speeds so it is by no means slow.

I don't know where the click comes from, but drive I/O goes through my
monitor's speaker.

The key-click comes from the internal speaker in the 400/800. On the
XLs, the key-click comes from the monitor speaker. Thus, one could
have a fifth voice if one really wanted.

Well one of my hopes would be that the floating point stuff would
act just like the Atari F.P. routines, so you could write the
software now... and it would slow, and if the accelerator ever
became a reality then you simply plug it in and watch the same
program faster.

Sort of along the same lines as this thread, does anyone know about AMY chip upgrades? I know that the 65XEM never made it past vaporware, but I remember reading somewhere (Antic, Analog) that 3rd party vendors were going to release an upgrade.

w.r.t. Colrview loading one big file, rather than three individual files:

I suppose I could make file creation easier, so you could create the three (or one) files just by pressing buttons or such. I was considering doing the following: change Colrview so that it can accept .R/G/B files as it does now, but then output one file in a compressed format (like Koala). It would of course also be able to load files it has created. Somebody gave me some code that would do just that, but I never used it until now. Besides, APACVIEW is running out of available RAM; I can't pack much more code in. The current run address is $2800, and it uses from there to the top of RAM ($BFFF?).

The AMY was supposed to be an awesome sound chip. I never heard about
it for a while after Atari announced the 8 channel 65XEM so I just
figured it never made it out of R&D.

> something similar to save a file?
>
> Bill Marcum

Well.. for one, that IS how you do it. Hell, you can even load a
non-gif, then go back to reload the gif you were messing with before and
still be in the same zoom/etc. (at least with v.2.3..??)

Also...if you ran out of space on a disk saving 3 r g & b files, you'd
still have to move them around and stuff. Jeff...you should add a ditty
that'll say what types of files can be saved (like the comp.eyes capture
software does!). That'd be pretty cool. Also...not to complain,
BUT... you know when you read a directory, I'm used to (using Bob Puff's
stuff) hitting [space] when it says [return]. His doesn't care (he
shouldn't have said "[return]" at the prompt, tho!!), but yours is an
line-input rather than a 1-byte get. Oh well...I'm in a bad mood (one i
like to complain about things) blah blah and all that--

I never heard them call it mutitasking. All XDIV does is turn on and off
the ability to redirect I/O (as in batch processing, or the PRINT command).
I usually find the first think I have to turn off is KEY (the keyboard
typeahead buffer) when it comes to finicky programs.

Source record: 111329

```
-- POWER USER'S SALE --

Well, I'm going back to school in the
fall and I've decided to sell all of
my collected Atari equipment. This
was a very hard decision to come by,
but I simply can't drag this stuff
around with me. My Atari has been a
faithful companion since about 1984
and I hate to see it go. I hope these
things go to a loving hacker. I just
don't have the time to devote to it
anymore and the poor thing is looking
very bored.

All items are in working condition.
They are, in fact, being used at
this moment. Full documentation is
included with nearly every item.

I will entertain lower bids on each
item, especially if you are interested
in several pieces. I may ask for you
to add postage if it is a particularly
large or heavy item.

Please contact me at any of the
following addresses if you are
seriously interested:

--- HARDWARE ---

Atari 800XL (Modified) $150
Includes:
RAMBo XL (256K)
Transkey v2.4 with SRAM option
```

BASIC rev. C onboard
Cold boot hardware reset switch
Power supply
Notes:
Case will not close because of
everything added! Was planning
on putting the whole thing in
a PC case...

MaxiSwitch PC Keyboard $35
Includes:
Atari graphics characters decals.
Transkey key template.
Notes:
An excellent keyboard for use
with Transkey (installed in
800XL).

Atari XF551 (Modified) $210
Includes:
Innovative Concept's 3.5" upgrade
Power supply
Notes:
This is a dual-drive system. The
original 5.25" mech is still
there, along with a 3.5" mech on
top. Each has its own XF551
case. They are connected to
each-other via a ribbon cable.
You select between the mechanisms
by flipping a toggle switch on
back.

ICD R-Time8 Cartridge $35

ICD P:R: Connection $40
Includes:
Modem (serial) cable
Printer (parallel) cable

Atari 820 Printer $25
Notes:
This is an old 40-column
dot matrix printer. Useful
for program listings.

Atari 1020 Plotter $10
Includes:
SIO Cable
Power supply

Atari 1010 Cassette Recorder $10
Includes:
Power supply

KoalaPad Graphics Tablet $15
Includes:
Stylus
Micro-Illustrator Software

Atari Paddle Controllers $5

Mindscape Power Player Joystick $10
Notes:
Personal favorite.

Epyx 500XJ Joystick $10

(2) New Joystick Cables $5 (For both)
Notes:
For fixing old joysticks or for
other projects.

SIO Cable with only one connector. $1
Notes:
For hardware projects.

Samsung Composite Green Monitor $35
Includes:
Home-made monitor cable with
multiple outputs (for hooking
up to your stereo...)
Notes:
Great for 80-column displays like
Kermit65. No speaker. (Simple
enough to hack one in there...)

Nick Kennedy's SIO2PC Connector $40
Includes:
Latest versions of his software.
Notes:
This allows you to use your PC's
hard disk as if it were attatched
to your Atari.

Antic Sampling Processor $10
Notes:
From Antic February 1990. In
a case.

Cheap-Talk Voice Synthesizer $25
Includes:
CTS256-AL2 companion chip to
voice synthesizer for furhter
enhancement.

Notes:
From Analog magazine. No
case.

Pokey Chip $2
Notes:
For Gumby upgrade.

--- SOFTWARE ---

Hi!

I'm interested in the
following equipment that you recently
posted on the internet. I'm willing
to pay full price for everything but
the Technical manual, whick I'll
gladly pay $15 for...

KoalaPad Graphics Tablet 15.00
Stylus
Micro-Illustrator

SIO Cable w one connector. 1.00

CARTRIDGES:
Atari Microsoft BASIC II 5.00

Atari Technical Notes 25.00
Operating System User's Man ($15?)
Operating System Source List
Hardware Manual
XL Addendum

36.00

Have you considered one price for all
the magazines? I'm curious!

Thanks, and I look forward to hearing
from you,

John

Subject: You never know how big 2 1050s stack are until you get 'em!

Have you ever tried stacking two 810 disk drives, then? <grin>

I FINALLY GOT ANOTHER DRIVE! AFTER ALL THESE (about 6?) YEARS! YIPEE!

Now I can't close my desk!! and I feel sort of overpowered by it's
size! BTW: is it bad to stack 2 1050s? Should I get that new
desk I've been whining about for 2 years? Hmmm???

Well, I've never had any problems with stacking two 1050s. They can
get hot, so make sure you've got ventilation for the backsides of
them. Otherwise, I wouldn't worry.

gee time flies! Bill

This is probably an FAQ, but is there any kit available that allows me to put an interface between my 130XE computer's serial port and my IBM PC, so I can boot the 8-bit computer with the PC acting as a disk drive? (I realize this requires some special piece of software to be running in the PC.)

No, when I put 3.2d, I was not refering to the cart. SpartaDOS X started as v 4.17 and was upgraded form there. As far as the XDIV when even though YOU never heard is addressed as Multitasking, that was the term used during phone communications to ICD. Anyone who knows anything about SpartaDOS knows that 3.2d is a disk based version of SpartaDOS.

I have 2 1050s stacked and they work OK. The vents are angled to the side,
so the top drive doesn't cover them up. I have also stacked 3 drives and
they worked ok as well. Didn't do the desk much good (one of them was an 810!)

JJMCWILL@MTUS5.BITNET (Jeff McWilliams) writes:

>I have a chance to pick up this package fairly cheap. Does anyone
>know anything about it? Can anyone vouch for its merits or shortcomings?

Yeah I use this and have done for some time. As you know its cartridge
based with a disk program too. The disk part transfers ok to SpartaDOS 2.3
with a DOUBLER format for extra speed and time-date stamping.

I like this software. You edit in a plain screen with no menu bar -- it
is brought up by hitting OPTION or ^O and there are the usual menus for IO,
spell check etc.

One problem is that there is no proper print preview :(You can sort of
print to the screen, but your printer has to be on-line at the time.

Overall, it is a good piece of software with a handy reference card and I
recommend it.

If you have any problems Jeff then email me and I will try to help.

Steve.

1891. MIO Cables

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-13 20:12:47 UTC

Marek Tomczyk's comments on ribbon cables w/the Amiga were interesting (IA8 V92#106), since I did spend a little of my vacatiuon time last week taking another look at the problem.
I'm generally skeptical of the validity of making comparisons to a similar problem on another machine w/out knowing what frequencies/waveforms are involved. I'm also skeptical of signal crosstalk being a significant contributor to the problem. I did a little checking on ribbon cable specs. Crosstalk for a 3m (10-ft) cable was spec'ed at 1.5% for the near end to 2.6% for the far end. I have trouble believing 2% crosstalk will totally scramble a digital signal. Alternating sig-gnd-sig sounds like a step in the right direction, it would reduce crosstalk & improve RFI resistance somewhat. But for long cables you would need to do more than just isolate the signals.

Crosstalk is a function of capacitive reactance. The reason cross talk is isn't a major factor is because- somewhat to my surprise- specific capacitance of 28AWG ribbon is actually rather low: about 12 pF/ft which is as good as the best lo-cap shielded cables. I don't see capacitance as the problem.

What about DC resistance? Specific resistance of 28AWG ribbon is given as 0.08 ohms/ft. Ten feet of this cable will impose less than 1 ohm of resistance to any AC or Dc signal. That"s not even enough to cause a measurable voltage drop in most systems, forget about DC resistance as the cause.

Of course, the total impedance of the cable is the vector sum of the reactances plus the Dc resistance. Having disposed of capacitive reactance & DC resistance as proximate causes of the signal degradation, that leaves one major quantity not yet considered: inductive reactance. It is my personal opinion that in fact inductive reactance is the real culprit here, all the other factors are minor contributors. Specific inductance for standard 28AWG ribbon is given as 80uH/ft. Eegads!! In other words, it's an RF *filter*! A 5-foot cable will impose a 0.4mH inductance upon the signal. People, that much inductance will attenuate *audio* frequencies; an RF signal will just plain be squashed. In other words, you can't do it, period.

So, how do you get round the problem? Certainly not with ribbon cable! The only way to reduce inductive reactance is to increase the conductivity of the medium. There are 3 ways: 1.) Lower the temperature (liquid helium is nice); 2.) Use the most efficient room-temperature conductor (100% pure silver comes to mind); 3.) Use heavier gauge copper wire. Obviuosly the last alternative is the only practical solution. Combined with Marek's idea of isolating the signals w/grounds, it should work. So, what gauge cable should you use? I'm not sure, I didn't study up on the properties of other gauges, especially their specific inductance.

There is some good news. Lo-cap shielded cable is readily available. I think the wire in these is typically #22AWG. Assuming inductance is a linear function

of wire thickness, & if my memory is correct in recalling wires double in thickness every 3 standard values, then lo-cap cable w/22AWG conductors should attenuate only half as much as the same length of ribbon cable. This might be enough margin to allow lengths of 2-5 feet (I'm guessing). Each signal should be paired with its own local gnd return (twisted pairs) to provide a lo-impedance ground, with an overall braid grounded at one end to prevent the thing from radiating/attracting RFI. Since the MIO & BB do not actually use every finger connector on the PBI (I think there are only about a dozen signals), you should be able to get by with lo-cap shileded cable bearing 25 #22AWG conductors (12 twisted pairs + shield drain) terminated w/shielded DB-25 hoods. Of course, some weirdo adapter will be needed to go from 50-pin edgecard to DBN-25, then another adapter at the MIO/BB end.

FOOEY!!!

I'm right now in process of getting my BB online, & converting from edgecard to shielded round cables is a royal pain in the butt.

For myself, I solved the PBI cable problem by buying a whole new desk! I needed more space anyway, to add 1.4M floppies & hard drives.

"Swiss Army Desk", made by O'Sullivan, very nice, I got it at an office supply place. One of those things you have to assemble yourself, after you have recovered from the hernia you got dragging the heavy cartons from the car to the living room.

1892. Blackbox/MIO comparison

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-13 20:59:56 UTC
From: Dawn_Scotting@kcbbs.gen.nz
Message-ID: <75596.1339221977@kcbbs.gen.nz>
Source record: 111334

From: fseipel@hpuxa.ircc.ohio-state.edu (Frank E. Seipel)
Date: 23 Oct 90 03:08:48 GMT
Organization: The Ohio State University (IRCC)

Having had the opportunity to use both the BlackBox from CSS (Computer Software Services) and the MIO from ICD, I thought I would share what I have learned about these two unique pieces of hardware for the 8-bit Atari. The systems I have used include: 130XE computers (upgraded to 512K), 1-meg MIO 256K MIO, BlackBox, Supra Modem 2400, Seikosha MP1300AI printer, 2 Happy 1050 floppy drives, an Adaptec 4000a hard drive controller, 2 Adaptec 5500 hard drive controllers, a Seagate ST225 20 meg hard drive, a ATASI 3046 40 meg hard drive, and a CMI 5516 13 meg hard drive.

What is an MIO or a Blackbox?

An explanation of just what the MIO and BlackBox are is in order. Both include a SASI/SCSI hard disk interface, a printer port, a RS232 port, and some type of printer buffer. The MIO comes with either 256K or 1 megabyte of dynamic RAM on board which can be used as any combination of ramdisk(s) and printer spooler. The BlackBox comes either with no user ram or 64K of static ram which can be used only as a printer buffer. Additionally, the BlackBox (BB) can use the standard extended banks of a 130XE as a 64K printer buffer.
The RS232 and/or printer ports can be disabled in both units to allow an external device such as an Atari 850 interface to be used.
Both come with clear manuals printed on 8 1/2 by 11 inch unbound paper. The pinouts for all ports are clearly shown in the manuals and there are examples showing how to set up a hard disk system. The BBS manual includes several short assembler listings showing some methods of accessing the BB from machine language.

Appearance

The MIO comes in a nice gray case with the SCSI connector and printer port on one end. The other end has the RS232 port, on/off switch, power plug, and two LED's - one is a power indicator and the other lights up when the MIO is busy. My 1-meg MIO has a second 9 pin plug on this end for a planned 80 column adaptor which never happened. The 50 conductor ribbon cable which plugs into the computer is on one side.

The BB comes with no case. Cases are available for it for $39.95 (and they are even black!). On the front edge is the connector which plugs into the 130XE. The other side has the SCSI connector, the floppy controller connector (see below), and the power plug. The printer plugs onto one end and the modem to the other. The BBS also has two LED's which serve the same functions as the ones in the MIO.

Plugging it in

The MIO has a 50 pin connector which plugs in to the parallel expansion port on a 600XL or 800XL. An XE adaptor must be purchased for $16.95 to plug the MIO into a 130XE computer. This adaptor plugs into both the ECI port and the cartridge port on the 130XE and has sockets for two cartridges on it. The second cartridge plug is primarily for R-Time 8 cartridge from ICD.
The BlackBox is built to plug directly into the 130XE. It comes with a short 5 pin cable for plugging into an XL machine. No extra adaptor is needed. For my own system, I use the XE adaptor from ICD and plug the 50 pin cable on the BB into it (I use the R-Time 8 and this keeps the cartridge stack shorter).
The MIO has the expected 9 pin and 15 pin d-connectors for plugging in your printer and modem. The BB comes with 34 pin card edges for use with 34 conductor ribbon cable. You can use both standard crimp-on connectors for both cables (use 25 conductor ribbon cable for the modem cable) or you can buy the cables you need from CSS. There is also an unused 34 connection card edge on the BB. This is for the floppy controller that CSS is planning to release. This floppy controller will allow the user to attach industry standard disk drives -- up to 80 track 720K - to the BB.
The MIO comes with a heavy duty 9v power supply. The BlackBox comes with power supply which has +12v -12v and +5v output. All three voltages are used by the BB.

Menus

Both the MIO and the BlackBox have menus. Here is a list of options available from the Main Menu of both:

1) Assign drives as floppy disks, or hard drive partitions. When assigning floppy drives, you can assign any physical floppy drive as and drive from D1: to D8: (and D9: on the BlackBox).

Note: On the MIO ramdisks can also be defined. These ramdisks refer to MIO memory only - not memory available inside the computer. A DOS ramdisk handler must be used for memory in the computer.

2) Swap drives - shows up as 'Exchange Drives' on the BlackBox and allows you to swap the drive assignments of two drives. For example, you could swap drives 1 and 4. The drive assigned to D4: would then become logical drive #1 and you could boot from it while the drive that was drive 1 would then be addressable as D4:. I am writing this using PaperClip which I booted from my hard drive using this method.

3) Lock Drive - Write locks a drive if it a hard drive partition or a RAMdisk.

4) Save configuration - This writes the current configuration to the first sector of device 0,0 (the first hard drive on your system). If no hard drive is present this option does nothing.

The other options available from these menus are different enough to need separate descriptions.

The MIO Menu:

The MIO Menu is entered by holding down the <Select> button and pressing <Reset>. This loads the menu into the computers program ram starting at address $3000. This destroys whatever was there, so it is best to re-boot the computer after accessing the menu. The Main Menu is the drive configuration menu. This is where you set up your hard drive partitions, partition the MIO ram into ramdisks, and assign floppy drives. The printer and RS232 menus are also accessed from here.

Available from the Printer Menu:

1 - Pause/Resume printing
2 - Clear Spooler
3 - Print Repeat copies
4 - Set port type
5 - Set spooler size
6 - Set Port Number

The 'Repeat Copies' option allows you to print copies of any text currently in the MIO print spooler. Setting the port type allows printing to either parallel and serial printers. This function is also used to turn line feeds on/off. Spooler size is adjustable in 32K byte increments from 0 (OFF) up to the maximum ram available on the MIO. Maximum available ram includes all ram on the MIO not already assigned to ramdisks. The port number can be set to P1:, P2:, or OFF.

Available from the RS232 Menu:

1 - Set Baud Rate
2 - Set Stop Bits
3 - Set Parity
4 - Assign Port Number

Baud rate can be set from 110 to 19,200 baud. Stop bits can be set to either 1 or 2. Parity can be set to None, Odd, Even, or Space. Since most terminal software handles these items, I am not sure why they are on the menu. Maybe it looked empty without some extra options (R1:, R2:, or NONE are the allowable port assignments).

The BlackBox Menu:

The BlackBox Menu is entered by pressing a button on the BlackBox. This menu does not use any programming ram and is therefore non-destructive. You can enter the menu and usually exit with no effect on the program you are running.

Available from the BlackBox menu are:

1 - Drive configuration menu
2 - Port Status Menu
3 - 6502 Monitor

From the Drive Configuration Menu you can partition your hard drive, assign floppies, add hard drive partitions to the partition list (explained below),

enter the Controller Menu, or enter the Partition List Menu.
The Controller Menu allows you to add up to 8 different hard drives to your system.
The BlackBox allows you to have up to 96 hard drive partitions. The information on these partitions (size, start sector, controller and drive number, etc) is kept in the Partition List. You are allowed to name each partition with any name of up to 11 characters; 10 of which show up in the menu.
The Main Configuration Table of the BlackBox has room for nine drives (and/or partitions). You can load any partition from the Partition List into the Main Configuration Table by going to the Partition List, moving the cursor to the partition you want and pressing <Return>. You will then be returned to the Main Configuration Table and asked what drive you want the partition loaded as.

Options on the Port Status Menu are:

1 - I/O Sound On/Off
2 - RS232 Port On/Off
3 - Printer Port Number
4 - Printer Line Feeds On/Off
5 - Spooler Status
6 - HD Partition List Start Sector
7 - Save Configuration

Yes, I/O sound with a hard drive, heh! The RS232 port an only be turned on/o with no option to be assigned as anything other than R1:. The printer port can be assigned as any one of P1: through P8:, ALL, or NONE. Spooler status cycles between off, XE extended banks, and BlackBox ram (if the ram is available on the BB).
This is also where you tell the BB where to look for the Partition List which takes up to 14 sectors and can be located anywhere on the first hard dis on the system. You can save the configuration here as well as from the Drive Configuration Menu.
The 6502 monitor is the best I have seen for the 8-bit Atari. It doesn't have as many features as others but it is transparent to the system and d es a MUCH better job of interruping a program than either DDT or Omnimon. I have retired my Omnimon and never used DDT much anyway. With the BB Monitor you can interrupt a program, examine/change memory, and usually resume right where you left off.
Ever had a lockup you couldn't get out of by pressing RESET? With the BB Monitor you can change the program counter to point to $E477 (the cold start vector) and when you exit the BB the computer will cold start. This is nice for saving the files in your ramdisks.
Note: While snooping in the BB ROM I discovered that holding the Help key and pressing Reset causes a cold start. Holding Shift-Help does not cause the cold start. This feature was not mentioned in the documentation.

Software

Other than programs to format hard drives, the only software I am aware of for these devices requires SpartaDOS. There are programs to:

1) Swap drive assignments
2) Lock/Unlock drives/partitions
3) Load/Save configuration tables from/to disk files
4) Load/Save BB partition lists from/to disk files
5) Print information contained in configuration files and partition list files
6) Load a partition from the partition list into the configuration table of the BB.

There are also some .CMD files used by BBS Express Pro! sysops to work with the MIO. I am sure there is software available that I don't know about or forgot to mention here.

Miscellaneous

There are two buttons, two switches, and a bank of eight dip switches on the BlacKBox. One of the buttons is used to access the menu. The other dumps the screen to the printer. This can be done at any time.
One of the swiches allows you to select either text or graphics mode for the screen dump. In graphics mode all Atari graphics characters appear on paper just as they do on your screen. In graphics mode, screen dumps take the full width of 8 1/2 by 11 inch paper. This makes a Graphics 0 screen look like Graphics 2 on the printout.
The other toggle switch write protects ALL hard drives. This is handy when yo want to try out a new program and don't want it to mess with the hard drives.

The dip switches are used as follows:

1) Force printer fauly line to NO FAULT. This causes the BB to not send any data to the printer. You could have another printer interface (and printer attached to your computer and control which printer prints with this switch.

2) Enable hard disk port/high speed floppy SIO. This allows you to disable access to your hard drives and disable the BB's high speed SIO code for floppy disks.

3.) Enable parallel printer port

4) Enable RS232 port

5) Enable printer line feeds

6) Printer is a Prowriter (Used by graphics dump routine)

7) MIO compatibility mode where hard drives are concerned. The MIO inverts all data as it writes to the hard drive. In normal mode, the BlackBox doesn't do this. Flipping this switch to the MIO mode allows a hard drive to be used by either the MIO or the BlackBox. Note: This affects ALL hard drives that are online.

8) Unused

* Switches 3-5 are mainly for systems with no hard drives online. If a hard drive is present this information is contained on the configuration sector.

The BB gives more storage capacity on hard drives than does the MIO. It is able to format a drive using 512 byte sectors. These are accessed as 256 byte sectors after formatting. (Each 512 byte physical sector contains two 256 byte logical sectors).
CSS claims that using 512 byte sector format can add up to 20% to the storage available on a hard drive.
I gained a little over 10% formatting my 40 meg hard drive in this mode. I have a 40 meg drive that formats out as follows:

Format Type Sectors
MIO 256 byte sectors 146685
BB 256 byte sectors 148994
BB 512 byte sectors 162530*

*This is the number of logical (256 byte) sectors

The only way I have fouund to empty the printer buffer on the BlackBox is to enter the port status menu and cycle the buffer off/on.
Printing through the printer buffer with either the BlackBox or the MIO slows down both the printing process and the computer (especially when accessing the devices like disk drives).

Reliability

The MIO has been plagued by problems and rumours of problems since it was released. I personally know of at least 11 MIO's that had to be sent in for repairs at one time or another. (And I know only 8 people who own MIO's). I bought my MIO's second hand and both had been sent back by the original owners to be fixed. Here are some problems I have experienced when using the MIO:

1) Wierd things have happened when I used the printer buffer. Everything from wierd flickering and characters showing up on the screen to garbage being sent to the printer.
2) I could not use my Mac/65 cartridge and the ram in the MIO at the same time. When I tried, the ramdisk(s) formatted themselves whenever they felt like it and I had to use a sector editor to recover anything important.
To my knowledge no one else has had this particular problem.
3) When using terminal programs the MIO frequently locked up on me while I was online. I suspect that this is a problem when the MIO is the originator of a call because I know of many BBS's using the MIO that have been online for a long time with no such problem.
Note: Bobterm 1.20 claims to solve this lockup problem by supplying its own handler for the MIO which also allows it to transfer at a true 19,200 baud rate.
I have had no problems with the BlackBox except when I wired it into my 230 watt power supply. I reversed the +12v and -12v lines and fried a couple of chips. A normal person would not have done this.

Product Support

ICD has apparently lost interest in the Atari 8-bit machines. At this time they offer little support for the MIO. If anything goes wrong, they are not likely to offer any help to the user at all beyond fixing them for $40.00

+parts+shipping.
My own experience with ICD has left a lot to be desired. I have been using ICD products since about 1984. I use the SpartaDOS X-cartridge and when I first got my MIO, I couldn't exit the menu without the computer doing a cold-start. Thinking something was wrong with the MIO, I called ICD for help. I asked for technical assistance and my call was forwarded to Howard. I explained my system and the problem to him and he told me that the MIO was faulty and to send it in for repairs. He informed me that repairs would cost $40.00+parts+shipping.
Well, it turns out that exiting the MIO menu with a cartridge plugged in caused a cold-start with all MIO's. So much for getting good help from ICD for their 8-bit products (in fairness to ICD, I heard that they do a better job supporting their ST product line).
CSS, on the other hand has proved to be a gold mine for Atari 8-bitters. As I mentioned above, I fried a couple of chips on my BlackBox. I called CSS and (with some embarrassment) told Ron exactly what I did. Instead of saying "Send it in with your wallet, checkbook, and credit cards', he told me exactly what chip I had probably fried. I found the chips at Radio Shack (for about $2.00) and fixed my BlackBox. These folks really do care!
The people at CSS have answered some pretty dumb questions for me (and one or two intelligent ones too). They have even helped people with their ICD products!

From: PHVAX::POEHLAND 13-MAY-1992 18:14:31.52
To: INET::"comp-sys-atari-8bit@ucbvax.berkeley.ca"
CC: POEHLAND
Subj: Mail-In Campaign (Atari Classics)

Just wanted to acknowledge yooze guys who thanked the Campaign Committeee in the Digest for the mail-in effort.

Jeff McWilliams & I are kicking around ideas for the mag. I just came back from a week's vacation & am presently engaged in taming a Black Box. Beginning this weekend the planning for AC will get serious as we prepare AC's organizational document, the Publication Manifest. I'm hoping that will be completed in June.

Occasional cards are still straggling in, unofficially I figure we'll top out at around 600 responses. If that isn't a MANDATE, I'll eat my hat! <grin!>

BTW, anybody out there w/an idea for what you want in AC, now is the time!

1894. Atarians' Musical Tastes /OS Music Trivia Quiz

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-13 22:35:15 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9205132235.AA28064@smithkline.com>
Source record: 111340

Poring over a few past issues of the Digest following the recent thread of various folks discussing their personal music prteferences, I thought I'd throw my hat into the fray. Well, sort of. From what I've seen, I gather my own preferences are quite a bit different from most other folks. I won't say outright what they are, but I'll drop a REAL STRONG HINT by offering the following challenge:

Go into the XL/XE OS & access the audio self-test routine. It's a very pleasant little 6-note theme. I'll never forget the first time I ran the audio routine, it showed me this computer had a true touch of class, I was delighted.

OK, here's the challenge. You MUST get ALL the answers correct, partial correct responses just won't do. The first person to get them all right wins 3 gold stars & a genuine autographed dogbone. Answer the following:

1.) The title of the theme in the XL/XE OS self-test routine.
2.)The instrument for which it was composed.
3.) The FULL NAME & nationality of the dude that wrote it.
4.) The year it was written.
5.) The name of the composer's group.
6.) The FULL NAMES of the OTHER FOUR members of the group.

Heh-heh, now we'll see who knows phrygian from major/minor!

Remember, you must answer ALL SIX questions above correctly!!

Bon appetit!

> It would of course also be able to load files it has created. Somebody
> gave me some code that would do just that, but I never used it until now.

JEFF! ALL YOU NEED TO DO IS CHANGE or ADD A NEW LOAD ROUTINE TO
COLRVIEW! APACView works just fine for my idea. It can already append
pictures to a file already exsisting on the disk. Here's how:

load a gif into Red mode...
zoom in and whatever else...
save it as "whatever.rgb"...
change to Blue mode...
view the picture and use OPTION and FIRE to reload it into Blue mode...
save it as "whatever.rgb"... (it will say "overwrite or append?", you
choose append)...
change to Green mode...
view the picture..etc.etc.to make it load into Green mode
save it as "whatever.rgb" once more (again, appending to it, not over-
writting it)...
...
that's it. Now you're done! As for ColrView, all you have to do is add
another menu selection, or even just a prompt to the load routine that
says:
"load 3 files? (with extenders .r, .g, and .b)
or load 1 file?"
(in the latter case, the extender could be "rgb" or anything else
you want)

WELL?! BTW: the koala compression idea is GREAT, because IT NEEDS oNE!
:) and adding THAT to 1-large file loading would be simple too!

GET IT MON!? :) later Bill

1897. 5200 Parts

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-13 23:19:07 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9205132319.AA28252@smithkline.com>
Source record: 111343

Yup, Todd, go for it! ANTIC, POKEY, GTIA, & CPU in the 5200 are same as in XL/XE. I know, I bought 3 of them. The OS is different, & the 5200's lack a PIA. Still, considering Best & B&C get $3-$5 each for those custom chips it's a great way to lay in a few spares for next to nothing. All has been offering those for about a year & a half, they recently lowered the price to move them out a little fe faster.

The units come w/out pwr supply or controller. Most seem to have various video or memory failures. In the ones I got, all the custom chips were good. I pulled the boards & trashed the cases.

Hi,

I've been reading the posts about the similaries of the 5200 and the 400/800 line. I've always wanted to convert my 5200 to have a composite output jack instead of just RF. Has anyone ever tried this? Can I purchase some old 400 or 800 to merge(hack) the 5200 output lines? Any help would be appreciated. Thanks.

1899. Digi-Studio new prices ad again!

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-14 14:35:33 UTC
From: djg0@aber.ac.uk
Message-ID: <1992May14.143533.8439@aber.ac.uk>
Source record: 111346

Yes, sorry folks, it's Digi-Studio again! Since I last posted the info for it, I have been able to reduce the prices to the US and other countries by quite a lot. Package 1 on its own now costs 7pounds to other countries, and packages 1 and 1.5 together costs 10pounds to other countries. This means a saving of around $6 on packages 1 and 1.5. This leaves me with barely any profit at all, but if that's what it takes to sell some copies outside the UK, then so be it. The only way I can make the price lower is to have a US distributor. The way I have decided to do this is as follows: the distributor would receive a specially produced US version of the two packages on disk. He/She would also receive the user manual in A4 format for making into booklets in the US, or straight photocopying. This would be up to the distributor. Sorry, we don't have your strange paper sizes in the UK, so it has to be A4. A4 is slightly longer,
but not quite as wide as your standard paper size. I would need a royalty on each copy sold. The amount would be sorted out once a distributor was found. Of course, I would need somebody I could trust, because it would be impossible for me to know how many were being sold. I could send registration cards over as well. One would be sent with each copy of Digi-Studio asking the customer to complete the card and send it to me. This would be a good way for me to know how many copies have been sold. The US distributor would have absolute control over Digi-Studio in the US. He/She would advertise it, and do the duplicating of disks/booklets. I have already advertised it on the net quite a lot, an have received some interest in Digi-Studio. If anybody is willing to have a try at this then please email me:

djg0@uk.ac.aber.

if that address doesn't work try: djg0@aber.ac.uk or djg0@aberystwyth.ac.uk
---

Digi-Studio Information

Digi-Studio is a new piece of software for the Atari XL/XE series.

It allows you to play music using real sounds which have been digitized.

Digi-Studio comes with a keyboard player and tune player. The keyboard player lets you use your computer keyboard like a piano keyboard to play tunes, but using real sounds, rather than computer-generated noises as is usually the case with this type of program. You can have 3 sounds in memory and can quickly change between them while playing tunes.The keyboard player has responsive keys so that the sound will only play for as long as you hold the key down.Just like a synthesizer!! The Digi-Studio disk contains many sounds for use with the keyboard player, ranging from church bells, to pig grunts, to a baby crying, to screams, and lots of synthesizer sounds. In fact around 25 sounds in all. Why

buy a synthesizer when your Atari can do the same?!

The tune player allows you to play pre-programmed tunes using any of the available sounds on the disk. Five tunes have been included on the disk for you to play.

Digi-Studio comes on a DS/SD disk, and includes a printed manual. It is aimed at everyone, whether musically inclined or not! You may just want to use it for fun, or compose a tune with it! The comprehensive user manual makes it a joy to use!

Digi-Studio will only work on XL/XE computers with 64K RAM. No extra hardware is required. The sound samples just play through your TV speaker!

The full Digi-Studio package costs just 5pounds in the UK, and 7pounds for foreign orders, including printed manual, and shipping. All payments must be made in UK funds (pounds sterling) and paid by money order in sterling if you are ordering from a foreign country. Order your copy today!

Package 1.5 for Digi-Studio is now also available offering more features for Digi-Studio and loads more samples and tunes. This extra pack is available with package 1 only. Check the next section for details of this new package.

Digi-Studio Package 1.5

Digi-Studio Package 1.5 is a new set of programs which form part of the Digi-Studio suite of programs and utilities. It is NOT an upgrade to package 1. It is intended to be used in conjunction with package 1.

Package 1.5 contains two new programs for Digi-Studio: The Sample Editor and the Tune Compiler. Also included are 26 new samples and 18 new tunes for use with Digi-Studio.

The Sample Editor allows you to edit existing Digi-Studio samples, and also allows you to create your own by using a joystick. The Sample Editor has facilities for reversing samples (playing them backwards), copying pages of sample to other pages of sample, and also contains facilities to edit samples very accurately using a joystick. This edit facility also allows you to create your own samples. By using all the supplied facilities, you can create some very weird sounds! You can then save your samples to disk and use them in the Keyboard and Tune Players in package 1.

The Tune Compiler creates stand-alone Basic program modules for including Digi-Studio tunes in your own Basic programs. The resulting modules are output in LIST format for merging into your own Atari Basic or Turbo-Basic programs. The modules are self-contained and do not require any Digi-Studio program to play. Just imagine your game starting with a chorus of God Save the Queen in pig grunts, church bells, electric guitar, ..., or your own sounds created using the Sample Editor!

Also included on the disk are 26 new samples, including pan pipes, various guitars, dog woof, organs, synth sounds, and lots of effects!

Also, 18 new tunes are supplied for playing with the Tune Player, or for compiling using the Tune Compiler. These include: Yesterday, Hey Jude, View to a Kill, God Save the Queen, Happy Birthday, This Old Man, and many classics.

The manual is in A5 booklet format, and has been typeset using LaTeX, and printed using an Agfa Laser printer. The clear instructions make the software a joy to use!

Package 1.5 is not much use on its own, so will be sold along with package 1. The two packages together will cost 8pounds (UK) including P&P. Copies to other countries will cost 10pounds (UK sterling paid with IMO). Just fill in the order form below and send it with a cheque/PO/IMO payable to DEAN GARRAGHTY.

Package 1 on its own is 5pounds UK, and 7pounds other countries. See the first section of this posting for full details of package 1.

1900. News-Disk

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-14 14:45:49 UTC
From: djg0@aber.ac.uk
Message-ID: <1992May14.144549.9523@aber.ac.uk>
Source record: 111347

A couple of weeks back I asked if anybody read the News-Disk which I produce and put on the archive. Nobody has mailed me, so does this mean nobody reads it? The 5 issues I have produced so far are at the archive in directory "djg" and are called issue1.arc through to issue5.arc. Each issue contains various articles, some of which are written by me, some by other users in the UK, and some from the newsnet tidied into articles. They do sometimes contain details of things happening in the UK, so if you want to keep up with what's happening over here, then read them! The disks are in arc format because they are not straight text like ZMAG. They contain files of many different types. They always have .DOC text files contating articles, etc., but usually also have .COM files, .BAS files, .OBJ files and various others, which is why they are in .ARC format. Before unarcing, make sure you format a SD disk with DOS 2.5 and put DOS on it. The disks have AUTORUN files on and so need to be in DOS 2.5 format to work properly. Issue 1 contains the more detailed instructions about how to read articles, etc.

Please take the time to read them. A lot of people spend a lot of time producing them (especially me!). I will very much like to hear from readers, so that I know how many people are reading them. I would very much like to hear your comments relating to them. Thanks.

Dean Garraghty. djg0@uk.ac.aber

1901. You never know how big 2 1050s stack are until you get 'em!

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-14 15:07:00 UTC

Message-ID: <705879964.F00002@tdkt.kksys.com>
Source record: 111353

Well, the last article I saw on the MIO vs Black Box only refered to the version 1 of the MIO (the one with the unused video port. Those MIO were known to cause many problems with many users. So hopefully the article your thinking of placing on the new will refer to the rev 2 MIO which is trouble free.

1907. Re: Using IBM PC as disk drive

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-15 01:14:01 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <59050@cup.portal.com>
Source record: 111354

Yes, I've seen one demo'ed & I have the software/plans but never got around to building it. The guy who developed it will build you one for $39. As I recall, it's just a MAX232 chip (about $6) with the software to drive it. The developer intent was a cheap way to use inexpensive IBM drives etc for the Atari & he succeeded. Locally (Silly con Valley) you can pick up a clone with 10 meg HD & 360 k floppy for $150, so for less then the price of a XF551 ($189 total) you can get a HD, floppy, & ramdisk thrown in. Whoops! I forgot to check if the clone has a serial port! Add $15 if it doesn't. Let me know if you need his name.

--

Anyone have schematics for the original 800's video section? My 800 refuses
to put out color since a monitor cable I had on it shorted....

Or... Anyone have an 800 useful for parts for sale???

Email replies please....

thanks

> size! BTW: is it bad to stack 2 1050s? Should I get that new

Bill,

I like many readers of this news group have done just that for many
years now. I had four stacked up on on each other. In fact I just
gave my Happy and Super Archiver 1050's away a few months ago to
a chap down south of me.

A mod we did some time ago was to move the drive selector from the
rear panel to the front panel. This allows you to select which drive
is what.

If you have a doubler drive and want to boot say a Ultraspeed disk/
menu and the other drive is simply an enhanced 1050 it allows you to
select which drive is 1 and which is 2 and so on.

There is not much involved and it will save all the hassells.

Hmm... Yeah. I just was at an Emporium or some store on day messing with one of them. (Hated it because it didn't let me do "INPUT" like my Timex would! heh..how IGNORANT I was back then, eh?! ;)). Anyways. I just fiddled with it for a few mintues, and I suppose it was my mom and brother's idea to get one for me (they were there when I was messing with it.) I suppose they got me a 1200xl instead of an 800xl or 600xl because it was cheaper (??). DAMN glad they didn't get me a 600xl!!!! :)

1915. XL power supply specs?

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-16 03:04:33 UTC
From: deaven@physics
Message-ID: <v1u41INNh0s@agate.berkeley.edu>
Source record: 111209
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

Hello fellow 8-bitters. I just came into posession of some Atari 800XL and 600XL machines after only having an Atari 800. I want to run them from a battery and I have no idea what the current specifications are for the XL supply. I can figure out the voltages OK with a voltmeter, but I also need to know how much juice the thing wants to draw. I have no manuals for these puppies or I'd look this up myself. Would someone out there in net-land who is knowedgable about these matters please respond via e-mail and tell me how much current each of the supply rails is expected to source?

Thank you!

1916. Paint programs.

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-16 06:57:03 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <sHuukB2w164w@cyberden.uucp>
Source record: 111212

Ok. What's THE best paint program(s) out there? I know RAMBrandt's in the top's, but is it PD or still (C)'d?? Also, I know EscalPaint is VERY good (since it uses 256 colors at a time from a pallette of 25,000 some odd colors), but I'm PROBABLY not going to want to work with APAC style DRAWINGS (yet).. (not for gaming, at least). I'd like to get a paint program for use in adding pictures to games and the like. What do you folks recommend? Where can I get it? How much will it cost me? Etc.etc. (you'll all seen questions like these asked before!) Later
Bill
BTW: is there any program (other than the actual paint programs that use them) that can convert standard (62 sector) pictures into Koala compressed format? And how hard is it to load these back up? (I TRIED hacking the Okimate10 color printer screen dumper I got with my (now dead) printer, but it was VERY hard to find WHAT ML calls do what.)

Rick,

As of this writing we have gatewayed FNET in to Zone 3 Fidonet as well.
This will allow people in Australia and New Zealand to join in the
Z*NET FNET echo's.

This adds another 200 odd BBS's to the Z*NET echo. I look forward to
seeing you in the echo.

regards for the Z*NET Global News Gateway.

1919. Items for Sale!!!

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-16 16:32:48 UTC
From: seanm@terapin.com
Message-ID: <seanm.07u2@terapin.com>
Source record: 111214

Well, I still have some items for sale. If you are interested, send net mail or call at the phone number below.

1 800xl stock. No powersupply $30
1 1050 US Doubler. Power/IO $60
1 ACB 4000a SCSI-MFM cont. $50 (sale pending?)
1 ST225 Hard drive. Works. $50
1 ST251 Hard drive. Broken $??
1 AT style case w/135w power $45
1 BASIC XL cart. w/docs $30
1 Monkey Wrench cart w/docs $10 (collectors item)
(For 800 only. Right hand cart!)
1 850 with power and IO $40
1 850 no IO or power $30

I also have a real collectors item. It is an Atari color organ. It hooks your stereo to your TV to generate strange musical patterns. One channel appears to not work, but the unit DOES prodiuce nice pictures and should be easily fixed. It has the Atari name on it and alot of knobs and switches and is about the size of a bread box. $30 or offer.

Contact me seanm@terapin.com or call 510-724-8632 business hours pacific time.

1920. Re: Paint programs.

Newsgroup: comp.sys.atari.8bit

One of my personal favorites is BBK ART from Analog #56. It does not use DLI's so you only get 4 colors, but it includes a X,Y position output. For me X,Y is kind'a critical because I usually use gr. 15 drawing programs to make gr. 12 & 13 redefined character sets. My only problem with it is the lack of Koala Pad support, but if I recall (been awhile) it allows keyboard positioning so you can move one pixel at a time. I've got a few subroutines for horizontal compression & horizontal/verticle decompression (Not by me) that can be called from BASIC.
BBK ART is on Atari Base. Do you have any FNET nodes around you? I could E-mail you some files if you do. I don't know if I want to fool around with UNDECODE etc.

Hm, I really don't think they have a retailer in the U.S.
The only way I know to get this stuff is the address I've mentioned
last week. If you are really interested I'll write to them and
ask about other possibilities for Atari 8-bit die hards in the states.
I should have the anwser in about two weeks.

1922. help with interface

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-17 01:53:29 UTC
From: chuck@mrcnext.cso.uiuc.edu
Message-ID: <1992May17.015329.9320@news.cso.uiuc.edu>
Source record: 111217

help, please.

This may count as a FAQ and widely held knowledge, but hey, I just got this
800 (_very cheap_)a couple weeks ago, and am trying to turn it into
something halfway useful.

Is it possible to adapt a normal run of the mill 360K "IBM type" floppy
drive to work with the Atari 800's daisy chained serial I/O?

Is it possible to null modem to the that same interface, or do I
(practically) need to get something like ICD's P: R: Connection?

Please mail, as my dear old unix account is now long distance for me :(.

thank you

>desk I've been whining about for 2 years? Hmmm???

Probably not, but it would be a good idea not to put any more stuff on top
(like another drive). That could put too much weight on the bottom drive
and cause the casing to bend.

1924. Atari Trackball, special joysticks 4-sale

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-17 15:33:30 UTC
From: cohen@GOMEZ.phys.virginia.edu
Message-ID: <0095AB5E.152F88C0@GOMEZ.PHYS.VIRGINIA.EDU>
Source record: 111221

For sale-
Atari trackcall, includes the "manual" (actually, an instruction sheet).

LeStick Atari tilt-sensitive joystick (has a fire button; directions are
chosen by tilting it sideways), in its original box with manual.

A pair of Atari RADIO REMOTE CONTROL joysticks, as marketed for the
Atari 2600 (includes 2 wireless joysticks, base unit. require a 9V
battery for each joystick).

(I also have Atari 2600 units- one is the traditional design, kind of
simulated woodgrain; the other is the newer smaller design. With then,
I have a bunch (15-20) of cartridges).

Atari paddles (pair).

Atari keyboard controller for the 2600.

I'd really would like to get the best offer within a couple of days.
However, I promise that the first offer of the following will get the
items without any further due- Trackball $20; leStick $12; radio remote
control joystick package $25. BUT these prices are negotiable and if nobody
offers them (or something very close) I'll takethe best offer within a few
days.
Please e-mail to COHEN@GOMEZ.PHYS.VIRGINIA.EDU, or call (804) 293-8973
if you prefer.
Thanks.

You can try the 80-column driver written by JD Casten (I think) in
Antic magazine. An excellent driver is built into Kermit65 - it
works fine at 2400 baud. You can get the source code for that.

1930. AC/XE drive: New?? Atari product

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-17 22:05:44 UTC
From: chase@electron.rutgers.edu
Message-ID: <May.17.18.05.43.1992.3548@electron.rutgers.edu>
Source record: 111227

I was in Toys R Us this afternoon and I noticed they had a DS/DD disk drive from Atari for the 8-bits called the Atari AC/XE disk drive. They only had the floor model left, but it was a half-height drive and claimed to be for all Atari computers except for STs. I'd never heard of this drive before. Does any one have such a beast, or know when they were first released. I thought that the XF551 was the last drive released by Atari but I guess I was mistaken. Or could it be Atari still supports us poor 8-bit users (;-)).

Well, I finished a nice little program to view compressed MicroIllustrator
pics under Windows with the help of an old Atari BASIC program that
I looked at. I would still like to have details on graphics file
format on the Atari. Surely someone knows where I can get this info!

1932. 8-bit sources list

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-18 00:28:16 UTC
From: wilmott@remus.rutgers.edu
Message-ID: <May.17.20.28.16.1992.5390@remus.rutgers.edu>
Source record: 111228

Once again, here's my current listing of mail-order sources for the Atari 8-bit computers. If anyone knows that any of these sources are no longer valid (out of business, address change, etc) PLEASE let me know. I have personally contacted each of these sources at one time or another over the past year, and they were supporting the 8-bits at that time...

5/17/92 updated list

Software Infinity
642 East Waring Avenue
State College, PA 16801
Notes:Good PD selection. Also now marketing commercial European imports.

B&C ComputerVisions
2730 Scott Boulevard
Santa Clara, CA 95050
(408) 968-9960
Notes:Huge selection of software and hardware items. Also some new commercial games, unavailable elsewhere.

Page 6
P.O. Box 54
Stafford ST16 1DR
Good European commercial & PD selection of software. Also are the publishers of New Atari User magazine...see below.

Micro Discount
265 Chester Road
Streetly, West Midlands B74 3EA
England
8-bit commercial close-outs.

Telegames
Box 901
Lancaster, TX 75146
8-bit, 2600, 5200, 7800, ColecoVision

Gralin International
11 Shillito Road
Parkstone, Poole, Dorset BH12 2BN
England
Fairly good selection of commercial
8-bit software/hardware.

Steve Hoffee/K.O. Software
333 Peninsula Drive
Lake Almanor, CA 96137
Markets a selection of imported
commercial & PD software.

Sagamore Software
2104 Arapahoe Dr.
Lafayette, IN 47905
Good PD/shareware selection with
extensive documentation.

Change In Heat
12 Bella Vista Place
Iowa City, Iowa 52245
Independent programmer has produced
2 excellent commercial quality
games for the 8-bit.

Bresnik Software
555 Ware Street
Mansfield, MA 02048
Another independent, producing good
educational software.

UltraBasic
10 East 10th Street
Bloomsburg, PA 17815
8-bit speciality software.

NERDS Software
18 Wendy Drive
Farmingville, NY 11738
Printshop related.

IB Computers
9244 S.W. Beaverton-Hills Hwy
Valley Plaza Shopping Center
Beaverton, Oregon 97005
(503)297-8425

BellCom
PO Box 1043
Peterborough, Ontario, Canada K9J7A5
The largest PD/shareware selection.

Compsult
PO Box 5160
San Luis Obispo, CA 93403-5160
Closeout items galore.

No Frills Software
800 East 23rd Street
Kearney, NE 68847
Closeouts & Printshop graphics.

Miles Better Software
219/221 Cannock Road, Chadsmoor
Cannock, Staffordshire WS11 2DD
England
Excellent mail-order source for
the Atari. They have many games
which were never released in the US

Electronic Clinic
4916 Del Ray Ave.
Bethesda, MD 20814
Refurbished equipment.

Mars Merchandising
1041-B East Charles Road
Lombard, IL 60148-2059
Close-out software.

Kake Software
9 Smith Ct.
Vincentown, NJ 08088
Assorted theme disks.

Bacmun Software
1671 East 16th Street, Suite 629
Brooklyn, NY 11229
PD theme disks.

Alpha Systems
1012 Skyland Drive
Macedonia, OH 44056
Utility software & hardware.

American Technavision
15338 Inverness Street
San Leandro, CA 94579
(415)352-3787
Large selection of commercial
software at excellent prices; also
hardware replacement parts.

Best Electronics
2021 The Alameda, Suite 290
San Jose, CA 95126

(408) 243-6950
Known as *the* Atari hardware
store. If they don't have the
part you need, nobody does.

BRE Software
352 West Bedford Ave, Suite 104
Fresno, CA 93711
PD/Shareware.

C&T ComputerActive
PO Box 893
Clinton, OK 73601

Discount Video & Computers
1717 South U.S. 1
Fort Pierce, FL 34950

Starbase Atari Computers
2369 Austin Highway
San Antonio, TX 78218
(512) 590-7122

Palette Imaging
1 Closter Commons STE 789
Closter, NJ 07624-0400
(201) 767-3913
Offers new 1991 professional
quality ChromaCad modeling
package.

MWPDS
890 North Huntington St.
Medina OH 44256

Phantoms Atari 8-bit
Box 331 Levisa Road
MouthCard, KY 41548

Vulcan Software
PO Box 692
Manassas VA 22111-0692

Innovative Concepts
31172 Shawn Drive
Warren, MI 48093

1934. D.Garraghty's Digistudio

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-18 05:27:22 UTC
From: Jeff McWilliams <JJMCWILL@MTUS5.BITNET>
Message-ID: <92139.002722JJMCWILL@MTUS5.BITNET>
Source record: 111235

Since my email to Dean bounced more times than my Racquetball does during an hour's worth of play, I decided to just post this to him publicly. Once one has created a sound with digistudio, how difficult would it be to import the sound into a program written in Kyan Pascal, Action!, Faster than Lightspeed C, or MAC/65 assembly language. My choice of languages is rather specific as I am currently trying to examine each of them in the hope of picking one to do a programming project this summer.

Is Digistudio a viable tool for creating sound effects to be imported into programs, or is it rather a tool for editing and enhancing digitized sound? I am a bit unclear as to what it can actually handle.
Should I look elsewhere for a program to produce some straight forward beeps and bells? The program isn't a game, it'll be an application but audio feedback is to be an important part of the user interface.

1937. AC: Preliminary Format

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-18 14:41:37 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9205181441.AA19533@smithkline.com>
Source record: 111234

RE: Bill Kendricks' query regarding AC, the format we are basing our proposal upon is a bimonthly mag, 40-60? pages, w/a software disk every other issue, i.e. three disks/yr.
Right now Jeff & I are still kicking around iideas for the various departments, colmnists etc. & also beginning to make some preliminary contacts to selected individuals to fill anticipoated staff positions.
Jeff sent me the postcards, I'm organizing them & reading the comments people made. The real problem we have for staffing is the large # of folk who volunteered their services. We need maybe 15-20 people, we got ca. 300 volunteers!
BTW, just the sheer mass of these postcards is an impressive sight. It will take us awhile to sift thru all this stuff; staffing will sorta go along w/the creation of the magazine, we are starting totally from scratch.
We've had a couple suggestions to make the disk available separately from the mag, w/the mag at a reduced price. The exact details of that arrangement will crystallize when we hitch up a publisher, but it's an option we are keeping on the table.
I understand Unicorn may have received negative correspondence about AC from folks who already subscribe to AIM & who may fear they will forced to choose between AC & AIM. No doubt these people are members of we call the "straddler" market: users who own both an 8bit & an ST (I'm a member of this group myself, tho I'm probably the only member of this group who keeps the STe in the closet & continues using the old XL). We want to emphasize, AC WILL NOT BE A PLATFORM FOR ST-BASHING!! We NEED the straddlers, they make up a big chunk of our market. It is not intended that AC should compete with AIM, but rather be a supplementary publication catering specifically to the needs of the 8bit community, many of whom are fed up with the diluted coverage now given by all the magazines. We hope to resolve the dilemma by funneling a certain amount of material from AC into AIM, so the 8bit readers of AIM who don't wish to switch won't suffer any noticeable loss relative to AIM's present level of 8bit coverage. Again, the exact details of that arrangement will have to be negotiated. The advantages of AC over AIM to the 8bit user will be: 1.) 2-4 times as much coverage as AIM will carry; & 2.) it will be ALL 8bit, no paging thru tons of ST/Lynx/TT/Portfolio/ABC/Atari News & Vaporware to get to the 8bit goodies.
People who want coverage of internal Atari politics & world events can read Current Notes or NEWSWEEK.
People who want to read interviews with personalities from Star Trek can read the last year's issues of ANALOG.
Peoplw who want to know how to use their 800/XL/XE, will want AC.

1938. Power Requirements for XL/XE

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-18 18:43:57 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9205181843.AA20711@smithkline.com>
Source record: 111236

In reply to Dave Deaven's question on specs for 8bit power supplies:

Despite the multitude of pins in the pwr connector there is only one rail: +5V.
The pin connections are redundant to maintain low impedance on the supply line.
Three pins on one side are gnd, three on the other are +5V. I think there is
a center pin unconnected.

All the supplies for the XL/XE are spec'ed at 5VDC/1.5 Amperes. Of the four
major types Atari used, only Type I approaches its current delivery specs,
all the rest deliver 1.1-1.3 amps except for Type IV which was supplied w/the XE
machines. That one is a piece of junk, it doesn't even deliver a full amp.
For full details on specs/schematics/circuit descriptions/chassis photos of
the various supplies, see the November 1990 issue of Current Notes magazine.

I have a souped-up 800XL that draws 1.7 amps (!). Before I started hanging
all those gadgets onto it, I recall it drew 700mA or so. A stock 800XL, or 130
XE should draw about 600-700mA. The 65 XE will run maybe 500-600mA, & a 600XL
will pull 450-550mA. These are ball-park figures.

BTW, one of my trolls just sent me new type of supply I've never seen before
(Type V ???). I don't recall the part #, but it looks like a scaled-down
version of the Type IV & is rated to deliver only 1.0 amp. I don't know what
machine this was made for. 65XE? XEGS? Anybody?

There is plenty of interest over on our side of the pond, believe me! If it wouldn't be too much trouble, a lot of us over here would really appreciate it. (I even have a deal worked out to do any necessary translation.) If you haven't yet written, you might mention that by far the most useful medium for us would be diskette distribution, since they should have the object code (if not the source, too) available.

Thanks again for doing your American brethren a big service! ;^)

1943. Re: Converting 5200 to composite

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-19 04:27:02 UTC
From: Chris_F_Chiesa@cup.portal.com
Message-ID: <59262@cup.portal.com>
Source record: 111238

Andrew Lee <asl00@juts.ccc.amdahl.com> writes:

>I've been reading the posts about the similaries of the 5200 and the
>400/800 line. I've always wanted to convert my 5200 to have a composite
>output jack instead of just RF. Has anyone ever tried this? Can I purchase
>some old 400 or 800 to merge(hack) the 5200 output lines? Any help would
>be appreciated. Thanks.

I'd expect this to be very easy -- more a matter of TAKING OUT the RF modu-
lator than of ADDING something. I can't speak directly to the case of the
5200, but I did pretty much this very thing with a 2600 once and it took
all of two minutes with a pair of alligator-clip wires to set up.

For what it's worth, here's what I did with that 2600. Open the case.
Find where the TV connection cable joins the 2600, and look in that
vicinity for a silver metal box. Wires lead into and out of this box;
it contains the "RF modulator" which combines video and audio into a
"TV broadcast" type of "RF" signal. On the silver box, SOME of the wires
are bringing audio and video signals IN, and at least ONE is taking the
RF signal OUT. The wire that becomes the TV connection cable is the one
carrying RF OUT, so by elimination the OTHERS are carrying composite
audio and video. (With clip wires, connect the metal casing itself,
or whatever the "shield" part of the TV connection cable is soldered
to inside the metal casing, to the "outer" (i.e. "shield") part of your
composite-video cable; this should leave TWO wires: one of them audio,
the other video. I figured out which was which by TRIAL AND ERROR;
more-intelligent ways would include viewing signal levels on an oscillo-
scope, or tracing more of the circuitry. At any rate, when you figure
out which wire is which, connect the "wire that's carrying the video
signal" to the "inner" (i.e. "core") part of your composite video
cable.)

Disclaimer: I'm not an electronic engineer or even an electronics tech-
nician. I've just been LUCKY all my life. If you AREN'T as lucky as
I was, and you blow up your 2600 or 5200, DON'T BLAME ME.

Chris Chiesa
Chris_F_Chiesa@cup.portal.com
cable

and find the little silver box
, although I can't speak directly to
the 5200 per se. In college I once operated a 2600 through a composite
monitor, which took all of two minutes with a pair of alligator-clipwires
to connect.

For what it's worth, here's what I did on the 2600: Open the casea and
locate

1947. Yet More Atari Mags for Sale

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-19 09:27:59 UTC
From: psrjd@acad3.alaska.edu
Message-ID: <1992May19.012759.1@acad3.alaska.edu>
Source record: 111240

Hullo, folks. I've got a large supply of old Atari Magazines available for purchase (you name your prices) that have been taking up storage space for longer than I care to remember:

Antic back issues:

Volume 1 #6
Volume 2 #'s 1-12
Volume 3 #'s 1-12
Volume 4 #'s 1-12
Volume 5 #'s 1, 2, 3, 6, 7, 9, 10, 11
Volume 6 #'s 1, 4

All of these magazines are in reasonable condition (covers, etal), some more worn than others. Make an offer, plus shipping, and they're yours (InterNet address bellow.)

Analog back issues:

#'s 18, 21, 23, 24, 26, 29, 31, 32

The condition on the first three of (18,21,23) is not so great (though the covers are still here) but the others seem reasonable. Again, make an offer and they're yours (you pay shipping).

I hope someone out there can use these things, as there's no Atari 8-bit in my future (oh, for the 130XE or 800 days!)

Send all correspondence to:

PSRJD@ACAD2.ALASKA.EDU

or USnail (begging the originators pardon):

>BBK ART is on Atari Base. Do you have any FNET nodes around you? I could
>E-mail you some files if you do. I don't know if I want to fool around with
>UNDECODE etc.

BBK Art is my favorite paint program too. And, it can load files in either Micropainter (62-sector) or Koala (compressed) form, and saves them as Koala files (Minor gripe 1: it only saves in Koala, not Micropainter. MG2: It's a one-drive program. You can only use drive 1 in Ataridos, or the current directory in Mydos; I don't have Sparta, but I think it works the same in Spartados.)

1949. Re: D.Garraghty's Digistudio

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-19 13:14:44 UTC
From: djg0@aber.ac.uk
Message-ID: <1992May19.131444.18231@aber.ac.uk>
Source record: 111244

Well, Jeff's mail did eventually get to me, but I might as well explain a few things to other folks who may be unclear.

Digi-Studio is being developed as a tool to allow people to use digitized sounds to create music. Currently 2 "packages" have been completed and released. "Package 1" contains 2 programs: the keyboard player and the tune player. "Package 1.5" contains 2 more programs: the sample editor and the tune compiler. Each package also contains lots of samples (20+ on each) and some tune files (5 on package 1 and 18 on package 1.5).

Package 1

The keyboard player is a program to allow you to play music "live" by using the standard computer keyboard. 3 octaves are allowed, but because of the limited number of keys on the keyboard, only 2 octaves are played at a time. The 3rd octave is accessed by using OPTION and START. 3 sounds are loaded into memory at a time, and you can change which sound you are playing in while you are playing music. It's your choice which 3 sounds you have in memory, but 3 default sounds are loaded during boot-up.

The tune player allows you to play special tune files in any of the digitized sounds supplied in either package of Digi-Studio. Currently, tunes are only played in 1 sound. Again, the sound is up to you.

Package 1.5

The sample editor lets you load in any sound sample and fiddle with it! You can reverse the sound, copy chunks of it to other parts of the sound, display the sound as a graph on the screen, and you can edit it very accurately by using a joystick to change speaker position values. This way you can also create your own sounds using "pages" which in this case represent 32 speaker positions. The manual for package 1.5 is very detailed about how sounds are played and what we mean by speaker positions. When you've created 1 or maybe a few pages you can use the various copying functions to create a whole sample which you can then save to disk and use as any other sound sample.

The tune compiler is quite a simple program. It simply creates a Basic module for playing Digi-Studio tunes in Basic programs. Digi-Studio uses a small piece of machine code to play samples. From Basic, USR commands send values to this code to instruct it to play certain notes. The only other thing needed is timing, which is done using the system clock. If the language you are using has an equivalent to USR then you'll be OK! The Basic module created by this program works in both Atari Basic and Turbo-Basic, and possibly other versions of Basic.

"Package 2" is still being developed. This will allow you to create your own Digi-Studio tune files. This package is quite a task to write, and will require more expert help in the music field. Expected release: later this year.

Prices

Package 1 only costs 5pounds in the UK and 7pounds elsewhere. Packages 1 and 1.5 together costs 8pounds in the UK and 10pounds elsewhere. Package 1.5 is not being sold on its own, because it doesn't really have much use on its own. All payments must be made in UK funds using and IMO. I have posted the official sales info on the net many times so I'm not going to bore you with it again! However, if by some chance, you haven't seen this then mail me and I'll mail you a copy.

Hope this helps! Dean Garraghty. djg0@aber.ac.uk or djg0@uk.ac.aber

1952. OS Trivia Quiz

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-19 14:40:49 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9205191440.AA00311@smithkline.com>
Source record: 111246

Hmmm... no takers for my OS trivia quiz, eh? There's a few folks out there who think the quiz is too hard. Well gosh whiz, people, it IS trivia.

OK, maybe 3 gold stars & a genuine autographed dogbone isn't enough of a prize to stimulate some answers. So, maybe I need to offer a more substantial reward, something people can relate to. How about TEN BUCKS cold cash?

C'mon, guys, SURELY I'm not the ONLY 8bitter out here who recognizes the tune? All of you XL/XE people have heard it, no one (that I know of) dislikes it, it's a pleasant catchy little melody that begs to have its 2nd bar completed (an additional 7 notes).

No, whoever wrote the OS didn't make up the tune, he/she took it straight from the treble clef.

If you pride yourself on knowing everything about your XL/XE & cannot at least give the title/author of the tune, shame, shame, for shame!!

But, to win the $10, you still have to answer ALL the questions correctly!
Please post your answers to the Digest, not to me!
I'll re-post the original challenge shortly.

Subj: Re: AC: Preliminary Format

With regards to the software disk, what would be the possibility of making its contents ftp'able? Granted that you don't want to open it up to people without subscriptions (if, indeed, you don't), it would still be a simple matter to email each subscriber who wanted to participate via ftp a password good for the current "release", and change it three times a year to control access.

Also, how about accepting submissions (articles and/or programs) via the InterNet? I'm sure many people would find this more convenient and less daunting than the usual submission procedure.

Finally, I would not be averse to seeing the magazine itself distributed on-line (maybe in scanned PostScript), a la Z*Net/AEO. At first it seemed it would be too much work for the editors to prepare a second, text-only edition, but then the scanned-PS occurred to me. I'm not sure, but I somehow doubt the magazine will be created with 8-bit DP tools, and any 16/32-bit architecture would have scanners and format-to-PS conversion programs available.

Just my $.02 worth. I would appreciate a reply if you have time. TNX.

1954. AC: Preliminary Format

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-19 15:21:55 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9205191521.AA00447@smithkline.com>
Source record: 111251

Michael Hill has made 3 suggestions i'd like to respond to.

First, on the the idea of making the software disk ftp'able, my response is negative. It might seem like a "simple matter" to email net passwords to interested participants, but it isn't, especially when you have set up the ftp site & multiply the # of parties by some factor of 10^2 or 10^3. AC will be run w/an absolute minimum of administrative overhead: the prime focus will be to produce articles, period. Anything AT ALL that adds to the administrative burden will be seriously scrutinized & probably rejected unless it will do a LOT of good for the MAJORITY of subscribers. It isn't like AC will have an office in a nice downtown skyscraper, with a receptionist out front. Instead, it will be a loosely knit group of people scattered all over the world, bound together only by a common cause. >sigh< nice idea tho.

Second, on the suggestion of submitting articles over the Net, my response is *VERY STRONGLY* positive. Absolutely, we will PREFER items to be submitted via this method whenever possible. I feel so strongly about this I am considering it to be an absolute requirement for Editors to maintain an acct on at least one network (GEnie, InterNet, or CIS). Guidelines for submission format & email addresses will be part of AC's Publication Manifest.

Third, regarding the possiblity of scanning the publication & uploading it somewhere, my response is neutral. Certanly we will not do it due to the administrative overhead, & I suspect our future Publisher might object. After all, it is theoretically possible to do that with virtually ANY printed matter, but there must be some good reason that it is generally not done, else by now someone wouild have scanned all the old issues of COMPUTE!, Analog, & ANTIC & uploaded them somewhere, not to mention AIM, CN, & Explorer. If someone does it it's there business, I don't want to know about it. AC is conceived from the very beginning as a purely print medium, deviations from that format will only add to the administrative burden w/out a concurrent improvement in service to the larger community. As I go thru the cards people returned I'm seeing *very few* email addresses, confirming my assessment that less than 5% of users are on networks.

The point about administrative overhead needs to be emphasized in light of the fact that this entire operation will be run by part-timers, all of them amateurs. Instead of having a few people working full-time, we will have many people working small-time, which is already an administrative kludge.

And when I say amateurs, that includes ME.

Thanks, Michael, for your input.

1955. HELP. word processor to ASCII

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-19 15:24:09 UTC
From: phile@pwcs.StPaul.GOV
Message-ID: <9205191524.AA25094@pwcs.StPaul.GOV>
Source record: 111253

To: comp-sys-atari-8bit@ucbvax.berkeley.edu

I run Bank Street Writer as a word processor on my Atari 800. I know, it is really low-tech.

Anyway, the other day I tried to load a Bank Street Writer text file from my floppy to my file space on the PNET bulletin board so I could Email it to my other account at pwcs. I used Xmodem checksum, and it seemed to transfer the file OK.

The carriage return code used in Bank Street Writer is not standard ASCII (big surprise). I put two carriage returns at the end of each paragraph to insert a blank line. When I Emailed the file to myself within PNET, the carriage return code did not appear in the text, and it did not cause the line return or even a space, like this sample:

...the last sentence in a paragraph.The first sentence in the next para...

I also did not insert a carriage return at the end of each line. The word wrap in my modem software took care of that while I viewed the file on PNET.

OK, then I Emailed it to my other account, which is a Unix account on a Sun system accessed by a Macintosh IIsi via TelNet. Now it looks like this:

...the last sentence in a paragraph.**The first sentence in the next para...

wherein each * signifies a ^ followed without space by a [.
I did not enter these four characters in this example because I did not want to cause any of you trouble.

You see, when I sent the file to a buddy of mine, his emulator read the four symbols for this double carriage return as a double escape and locked up his machine. He was sharp enough to download the file and open it with a bullet-proof reader to find out what happened and tell me. I can see the symbols on the file when I read it with elm, but they don't cause a lockup on my system, or apparently in most systems.

Also, carriage returns had been added at the end of each line by the mailer, so words were cut in half. I can see that I can solve both these problems if I can just get real ASCII carriage return codes into my Bank Street Writer document.

I need some Atari-type help to fix this. How can I put real ASCII carriage returns in a document file with Bank Street Writer? Can I enter something other than <return> in the original file while writing in Bank Street Writer? Is there a way in Bank Street Writer to save a document as an ASCII file? Can I modify the file after I put it on disk and dump Bank Street Writer? How do you open a Bank Street Writer file on a floppy to look at it, dump the

original codes and insert ASCII codes? Is there a way to edit files off-line with modem software?

I am not equipped with a lot of fancy software. I have a BASIC cart. I am running DOS 2.0, but I may have a DOS 3.0 disk around. I have not messed around much with this yet, and am no computer expert, so I may have missed something really simple. Please respond via Email to both my accounts.

Foggy past/mind <g>. I think you're right, + there were a few other minor annoying 'features'. Like the files must have the proper .MIC or whatever so you have to add it/forced to use it. It wasn't more then a minor glitch for me because I'd spend a couple of hours doing the drawing the char set, then [save it, rename it, load it into MI, save it uncompressed, use gr 15 to FONT converter, save FONT]. Life time, I don't think I've done more then 6 gr 12 FONTs. ANALOG distributed the source code with the .OBJ but I never felt the need to rewrite it to make it a little more friendly.

1958. OS Music Trivia Quiz: Re-post

Subj: Atarians' Musical Tastes /OS Music Trivia Quiz

Poring over a few past issues of the Digest following the recent thread of various folks discussing their personal music prteferences, I thought I'd throw my hat into the fray. Well, sort of. From what I've seen, I gather my own preferences are quite a bit different from most other folks. I won't say outright what they are, but I'll drop a REAL STRONG HINT by offering the following challenge:

Go into the XL/XE OS & access the audio self-test routine. It's a very pleasant little 6-note theme. I'll never forget the first time I ran the audio routine, it showed me this computer had a true touch of class, I was delighted.

OK, here's the challenge. You MUST get ALL the answers correct, partial correct responses just won't do. The first person to get them all right wins 3 gold stars & a genuine autographed dogbone. Answer the following:

1.) The title of the theme in the XL/XE OS self-test routine.
2.)The instrument for which it was composed.
3.) The FULL NAME & nationality of the dude that wrote it.
4.) The year it was written.
5.) The name of the composer's group.
6.) The FULL NAMES of the OTHER FOUR members of the group.

Heh-heh, now we'll see who knows phrygian from major/minor!

Remember, you must answer ALL SIX questions above correctly!!

Bon appetit!

I agree, programs like S.A.M. and the programming language called
Quick, and Dean Garraghty's Digistudio programs could probably
make quite good sales over here if there were someone to
distribute them and translate them. The 8 bit market isn't dead,
for an example of this I ask you to take a look at ChromaCAD.
It's sold over a thousand copies, and both the company and the
distributor can't seem to keep them in stock. European programmers
really seem to know how to write good programs. Look at TurboBASIC XL.

But I think the language and trade barriers need to be overcome.
I am interested in Dean's DigiStudio package, but I have no idea how
to obtain an international money order or some other way of sending
Dean a check in his native currency.
I feel this may be hindering many people from ordering programs
overseas.

I would guess that the "good reason that it is generally not done" is that
nobody thought, "Gee, wouldn't it be a swell idea to send out Compute! via
the InterNet for those subscribers who have accounts there?!" This is
probably related to your point about the 5% of users being on the Net.
<sigh> Oh, well.

It also occurs to me that distributing the magazine[s] that way would be
commercial use of the InterNet, which, as I understand it, is verboten.
Another good reason, I guess, why it hasn't been done before.

Well, thanks, Ben, for your output! ;^)

PHILIP,

It sounds like what you may really need is an ATASCII to ASCII conversion
program. But not being familiar with Bank Street Writer, I am not sure
about this. The problem is that the Atari 8 bits use the character code
155 as a carriage return and line feed, where as ASCII uses code 13 for
carriage return and code 10 for line feed. What needs to be done
is have a program do a search and replace for all instances of
155 and replace it with 13 and 10. There is a program for SpartaDOS called
SDVERT which does this very well, and Bobterm can be told to do it
automatically when transmitting a file. I am sure there are about a dozen
ATASCII to ASCII programs out there, most of which will work with
Atari DOS 2.0. Or maybe you can have your UNIX editor fix the codes.

OK, Ben, here are my answers for the atari8 OS music trivia quiz:

1). The theme is the Promenade theme from Pictures at an Exhibition.

2). Originally composed for the piano.

3). It was composed by Modest Mussorgsky, who was Russian.

4). It was written in the year 1874.

5). Mussorgsky's group was the FIVE (or the Mighty Five).

6). The other members of the Mighty Five were Mily Balakirev,
Aleksandr Borodin, Cesar Cui, and Nikolai Rimsky-Korsakov.

I just forwarded Bill Haga's answers to the OS trivia quiz to the Digest. Yup, he got everything right.

Actually, I was looking for the Russian "Kuchka" as the name of the group, but the English translation "Mighty Five" will do.

Thank goodness there's other 8bitters Out There who appreciate Classical Music, it was starting to get pretty lonely down here.

Unless I see a post dated earlier than Bill's, I'll declare Bill the winner. Send me your mailing address Bill, you got ten Big Ones coming!

>sniff sniff< Now what will I do w/these 3 gold stars & genuine autographed dogbone? Especially the stars, they weigh 7 pounds each & been wearing holes in the lining of my pocket.... <heh-heh>

Anyways, if anyone's interested, "Pictures" was the only memorable thing Mussorgsky ever wrote, he died a decrepit alcoholic. Cui went on to become a professional music critic & was roundly despised by most of his former buddies. Rimsky-K. turned pro, taight music & became almost as famous as his rival, Tchaikovsky. I have a special fondness for Borodin, he was a chemist like me, best remembered for publishing the acid properties of arsenic & composing a little gem called "Steppes of Central Asia".

I forget... is MicroIllustrator the one that uses the good ol'
uncompressed 62-sector format or does it do the Koala compression? If it
does the Koala compression, I'd love to have the code on it too! :)

Does anyone know how you go about programming for the mouse on the 8-bit?

I'm studying the Atari Mouse for my digital electronics class. I see almost no relation between which direction you move the mouse and what values it sends to computer. I know, it's not what the class is about, but I'm still curious.

I also seem to have discovered that the right button isn't even connected. I didn't realize the Atari world was right-mouse-button-less.

The Diamond GOS ("Graphic Operating System") used an ST mouse on the 8-bits and it worked quite well. I presume, of course, they there was some sort of software m.l interrupt being used to translate the incoming bitstream from the mouse, but it did work. They had a stand-alone program called Atari Cookbook which used drop down menus that looked for all the world like an ST in low-res mode!

>I also seem to have discovered that the right button isn't even connected. I
>didn't realize the Atari world was right-mouse-button-less.

The right mouse button is indeed used on the ST. Very little support exists for it at the desktop but MANY programs make use of it.

Well DUH, Oscar, -I- thought of THAT, myself. :-) It's just that I have no faith in MY local library. I'll be REALLY SURPRISED if they have issues of BYTE dating back into the decade-before-last! Around here, the libraries SELL or DISPOSE OF stuff like this every couple of years.

Don't get me wrong -- I DO intend to check the library, although it will probably take me several months to get around to it. I just don't expect that act to yield results.

1972. Only 128 colours?

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-20 09:46:08 UTC
From: etxansk@garbod20.ericsson.se
Message-ID: <etxansk.706355168@garbod20>
Source record: 111174

I've always wondered why so many of the graphic modes in the 800/XL/XE computers ignore the least significant colour bit. This means I'll only get 128 colours in, say, BASIC mode 15 (on an XL computer), instead of 256. I suppose it's a hardware limitation.

There would be no need to have more memory allocated for video data in order to have these extra 128 colours, 'cause the colour values are stored in 8-bit (7-bit?) palette registers.

Well, I don't know how this relates to the use of a mouse on the 8-bit, but on the ST there is "sort of" a right mouse button. The mouse port is cross-connected to the joystick port, so that pressing the right mouse button actually activates the joystick button, and vice-versa. I don't think the 8-bit has this same cross-conenction, so the right button wouldn't work.

1977. IMOs

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-20 11:45:25 UTC
From: djg0@aber.ac.uk
Message-ID: <1992May20.114525.2408@aber.ac.uk>
Source record: 111176

I was interested in what Jeff had to say about distributing European software in the States. I've been trying to persuade somebody to distribute Digi-Studio for ages now, and nobody seems to want to.

The reason nobody has bought a copy from abroad yet is because getting IMOs is expensive and time consuming. Or at least they expensive in the UK! I've no idea how to get an IMO in the States, but over here the post office can issue them, and some banks can issue them. If I wanted an IMO for $20US I would ask for a $20US IMO. I would be charged the amount in pounds to make up $20US at the exchange rate prevailing on the day. On top of this I would be charged about 5-10pounds for the service. It may be a similar system in the US. It could work out cheaper for me to charge a little extra and allow you to pay COD in $ when the package arrives. I would have to look into this though.

Dean Garraghty. djg0@aber.ac.uk

1978. Another way to get cash abroad!

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-20 13:26:07 UTC

Message-ID: <1992May20.132607.26496@aber.ac.uk>
Source record: 111177

I think I've come up with another way to get cash to me in sterling to pay for Digi-Studio. You could go to your local bank or Beareau De Change and get 10pounds in cash and mail me the cash using registered post. Not sure if this service is available by US post, but it is in the UK. This method may be cheaper than getting an IMO.

Dean Garraghty. djg0@aber.ac.uk

1979. Re: AC: Preliminary Format

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-20 15:13:49 UTC
From: exuhag@exu.ericsson.se
Message-ID: <1992May20.151349.22856@exu.ericsson.se>
Source record: 111180

On making AC available via Internet or similar networks:

IMO net access is *too* easy, making correspondence and dealings over the net a lot less meaningful than tried and true 'formal' methods. Writing and snail mailing a (paper) letter of complaint carries a lot more weight than banging out a note in a few minutes before class or a meeting and clicking on the SEND button. The distinction may seem minor but I think it is significant.

Being able to ftp a copy of Atari Classics may be a slight convenience, but it also implies a lack of commitment--that you aren't willing enough to actually go through the trouble to subscribe through normal channels. Encouraging such vaguely interested readers should not be a high priority.

Similarly, contributions via email could also be of lesser quality, but I trust the editorial staff's judgement in choosing quality articles. I'm hoping that there is a good balance between information useful for beginners and rehashes of topics which have been beaten to death over the years. Antic, in its later years, frequently resorted to the latter, reprinting Yet Another Banner Program and Yet Another Door Prize Picker, etc. Of course AC will also carry articles more useful to the serious hobbyist, I'm sure. I'm hoping it doesn't become The Atari Hackers' Journal, though, with a disproportionate number of articles on hardware modifcations.

Just my comments on the subject. Be prepared for more opinions when I have the time.

Michael,

Way back when in days of yore, there existed a company called Zobian
controls who were marketing an Atari 8 bit mouse called the RAT.
The original model was black with a Red button and looked a little like
a MAC mouse. I ordered the bugger. Later ads in the magazine
promised a desktop would be soon released. Months passed, and no
RAT appeared by either mail or UPS. I wrote another letter, and
tried to call them. The calls didn't go through. Finally I wrote
them a letter threatening to sick the better business bureau after
them if they didn't either refund my money or send me a mouse.
They sent me one, a nice Grey two button mouse, that looks a lot like
the BEST mouse that Best Electronics markets today.
It shipped with a little page 6 ml code that is callable from basic
that will read the x and y positions and store them somewhere.
It also included a graphics 8 paint program,but it kinda sucks.
The neat thing is, I plugged the mouse into a friend's ST, and it worked
just fine. You are correct, the right button doesn't work on an 8 bit.
I think if the Analog inputs of the joystick port aren't used, the
right button could be modified so that there is a series resistor
connected to the button, connected to +5v and the Analog input. SO that
the right button would be read as a Paddle input.
Later this week I will see if I can't find a disassembler and
disassemble the mouse handler and post it here. If you don't see it,
remind me!

If Bank Street does not allow for an ASCII save, then you may be able
to print to a disk file. Most WP's for the Atari allow you to enter a
device to print to i.e. P: or R:, so all you may need to do is D:UL.TXT
or something to that effect. I used to use Speed Script for composing
E-Mail & it works well. You should reset the margins to 0 or 1 for the left
& 65-80 for the right. If Bank Street does not have a "Print Selected Text"
option you may have to set your top margin to 0-1 & the page length equal
to the length of your message so you don't get a bunch of page feeds scoll'n
the message off the screen.

I find that weird, since I didn't find any outgoing wires from the mouse
that were affected by the right button. Wire #1 (black) looks like it's
supposed to, but it didn'ty seem to work.

I agree, it still has much information for the uninitiated who are interested in both products. The MIO hasn't changed that much, and even after I sent in my MIO and $40.00 plus parts it still crashed every now and then, and simply HATED the Dataque Turbo816 board. Like a real fool, I sold the MIO and kept the T816. Now I am regretting it.

Perhaps someone would like to update that review to reflect any inconsistencies in the article due to the MIO having improved firmware?

Marek,

If you could translate the documentation into even rough English
I might be able to further smooth it from there, knowing not a thing
about German.
I am delightfully surprised that someone is writing a book about
Quick and that there is so much support for it in Germany.
Could you e-mail me as to how I could get this thing, and start the
translation process? Currently I am seriously considering Action!
as my programming language, but it seems perhaps if I can get ahold
of Quick fast enough, it would be better to do it under that language
since it is newer and better supports the XL/XE machines.

But even if I miss the boat as far as doing this current project with
Quick, Action! is getting increasingly difficult to find, and QUICK
would make a good replacement for all those who want to get into
a compiled structured language. Looks like we need a distributor
for this thing in the U.S.

Jeff McWilliams
jjmcwill@mtus5.cts.mtu.edu

1986. Quick (was S.A.M. and MIO (was Favorite ...))

perhaps a week ago Jeff McWilliams writes:
>Can you give more details on this interesting sounding language?
>Could we possibly get some generous bilingual person to translate the
>documentation for us? It sounds very interesting.

After a hard week of taking maths I'll now try to describe the
language Quick (better late than not at all) :-)

Very much like S.A.M. (you remember: this mouse supported user
interface) Quick has been published as a series of articles
in the Geraman "ATARImagazin". Now this language is still commercialy
sold. The latest version is 2.1
Quick is a compiler language primarily designed for programming
games. The designers of Quick tried to implement a quick language
which takes advantage of as many new developements on the
8-bit Atari as possible. Therefore it supports gadgets like
ST-mouse, digitized sound, a Voice-box or fast graphics routines.
I would compare Quick to Action! It is sort of equivalent, that
means very close to assembler. You have mainly three different
types of variables in Quick: BYTE, WORD and ARRAY.
I think I should give you an exapmle of variable declaration.

```
BYTE
{
LMARG=82
}
```

with this you have created a BYTE variable with the name LMARG.
This variable is located im memory at the location 82 which controls
the left margin of the screen. To set the left margin to say the
7th column all you have to do is to write:

```
LMARG=7
```

now look what the compiler makes out of it. In the compiled progarm
you'll find:

```
LDA #7
STA 82
```

you can't make it faster. That way you needn't a POKE but it is
still available.
Quick supports procedures with local variables and passing variables
from and to the main program. You can even define a procedure for
the VBI, Quick is fast enough for that. Of course there are
structures like REPEAT....UNTIL, IF...THEN...ELSE, WHILE...WEND.
Quick hasn't been designed for extensive scientific calculations,

but there are floating point libraries included.
Libraries are very important in Quick. You can write procedures
by yourself, store them on the disk and then include to your
next programs like this:

```
INCLUDE
{
D:KEY.S
D:CODE.S
}
```

All functions in Quick refere to a vector area in memory. These
entries are documented. If you think you can write a faster
DRAWTO command in assembler than you simply redirect the proper
vector to point to your own routine. But this work has been done.
Quick has a library with this fast PLOT and DRAWTO routines making
advantage of fast functions like VLINE or HLINE.
This flexible concept allows you to improve the language.
Currently Quick allows multitasking of two programs with various
priorities to each program. What's more, your compiled program
can be up to 42KB long on a 800xl/xe or 68KB long on a 130XE.

There is still a lot of support for Quick. Once all month or two
the programers of Quick release a new "Quick magazin" which
is a disk magazine with programs in Quick and articles about
programming in that language. Also the printed "ATARImagazin"
has a series about Quick. In a few weeks there will be even a
book about Quick.

At the begining of my posting I told you that Quick were well
suited for programming of games. It really is. There are even some
commercial games available in Germany written in ..(guess)
yes, you are right written in Quick.
I have a demo version of one of them. I'm sure it is PD.
Maybe next week I'll go home for the weekend and then post it
to the archive to give you an example of what you can do with Quick.

I mast admit, I haven't programmed very much in Quick yet.
My Atari is at home and I don't have much time here on the
campus. Maybe at the summer vacation I'll go into it. Then I sure
will be able to write more about it, but until now it looks fine.
Jeff, I could probably be able to translate the docs. But then
I'll need someone to go over it and to "smoothen" my English and
to correct it.

Hope you got an idea....

I have all of them, but I seem to have missed your query about them.
I've all disks you put onto the archive including the digitized demos.
The one called 'Journey into the Sound' is really huge.
I liked the digitized-sound-story about that guy shouting 'HI there!'
It is a very good idea of making stories like that, we should make
more of that kind. Perhaps I'll try somethig like this during my
summer vacation.
I've kind of browsed through the News-Disk, they are very interesting
too. Until now I haven't got much time to read all of the articles.
That weekend I've downloaded more than 35 disks from the archive and
still couldn't unarce all of them because I'm at home very rarely.
Maybe next week ......

Ben Poehland writes:

> BTW, anybody out there w/an idea for what you want in AC, now is the time!

I would definitely like some hardware projects in AC.
I'm especially thinking of hardware hackings with the PBI.
We have had some very interesting ideas here in the newsletter,
to name one: a 65C02 hooked up to the PBI and processing
floating point routines with 8MHz speed (by Jeff McWilliams).
I would especially like to make a hard drive interface or to
connect a VGA graphics card to the PBI.
That's what I would like to see in AC.

personally, I don't think there's a big need for beginners stuff.
I may be wrong, but I'd guess that the majority of readers won't
need beginners info. I'd like to see a balance between hardware
hacks and programming articles.

>have the time.

James Hague expresses a legitimate concern. Obviously one of the priorities of the editorial staff will be to present a balanced offering of articles and columns to the reader. What this will most depend upon though is the articles and columnists we receive.

I agree, Antic in its later years were publishing nothing but more card game programs and such. But I do think their reprints from Mapping Atari were okay, as were Analog's reprints of earlier Boot Camp's. Those things I would place in the category of information for first time users, wherease another TIC-TAC-TOE game would be quite useless and unprintable.

It would be difficult if not impossible for AC to become everything for everyone, as it's impossible to please all of the people all the time. But rest assured the Editorial staff of AC will be doing its darndest to present a publication with something for just about everyone.

[LOTSa details about trouble using Bank Street Writer but not getting CR's deleted]

Well... here's a NICE little program you can make. Sure, it'll make files take twice as much room, but it works. (I'm not in the mood to mess with writing a fancy NOTE/POINT routine to just "edit" the single file...blah blah etc.) Anyways: This program will take the ATASCII RETURNS (character 155) and change them into ASCII RETURNS (characters 13/10 (13=carrige return, 10=line feed).

```
10 OPEN #1,4,0,"D:SOURCEFILE"
20 OPEN #2,8,0,"D:DESTINATIONFILE"
30 TRAP 100
40 GET #1,N:IF N=155 THEN PUT #2,13:N=10
50 PUT #2,N
60 GOTO 40
100 CLOSE #1:CLOSE #2
```

ok..here's a way to do it if you ONLY NEED the CR'S!!! (if this does NOT work, use the one above!!!)

```
10 OPEN #1,12,0,"D:TEXTFILE"
20 TRAP 100
30 NOTE #1,X,Y:GET #1,N:IF N=155 THEN POINT #1,X,Y:PUT #1,13
40 GOTO 30
100 CLOSE #1
```

The 1st program reads from SOURCEFILE and writes to DESTINATIONFILE. Whenever it crosses the path of the ATASCII [RET], it writes the 2-character [RET] that ASCII uses onto the DESTINATIONFILE. Anything else will be copied exactly.

As for the second program, it opens up TEXTFILE for read/write. It "notes" where it is in the file, reads from it (which moves the file pointer forward one) and if the read character is the ATASCII [RET], then it changes it to the ASCII carrige return (character 13..NO 10 is added afterwards like in the 1st program!!!!!). As a technical note (if anyone out there cares (if they don't already know!)), when it reads the 155, it "points" back to the last place it looked (just before the 155) and then writes. Inother words it says "whoa!", backs up and changes it.

God writing is fun!

>
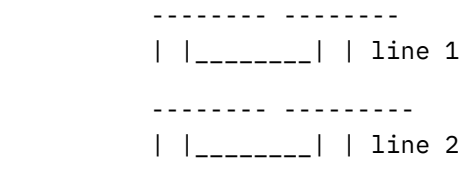
> I also seem to have discovered that the right button isn't even connected. I
> didn't realize the Atari world was right-mouse-button-less.

I hope you are talking about the mouse used for the Atari-ST line.
I know how to use it for the 8-bit Atari, or at least knew it
some months ago. I've even programmed a small routine in assembler
for it. To give you an accurate description I'll have to go home and
find the description somewhere...
Now I can give you only a preliminary description (hope my memory
serves me well) :-)

I think you are right according to the right-mouse-button, as I can
recall there really isn't a connection between Atari and this button.

according to the direction controll: it's a kind of tricky.
The lines 1 and 2 of the joystick port control the movement of the
horizontal direction. The lines 3 & 4 the veritcal directions.
(sorry if it's vice versa)
But the important thing is that when the line 1 is changed this doesn't
mean the mouse is directed to a particular direction. You have always
to consider the lines 1&2 together. Another point you have to consider
is the sequence they change. As you see the process isn't static like
programming with joystics but highly dynamic. Let me give an example,
maybe this makes it clearer:

Say me move the mouse to the left. Then the signal of the lines
will look like this (again, I could be wrong):



Do you have an idea what I mean?
Line 2 becomes 'low' a little later than line 1. If you drag the mouse
to the right, then the sequence of changes will be of a kind that

always line 1 will become 'low' (0) a little bit later then line 2.
To obtain the directions up & down you have to consider lines 3 & 4
in the same way. But, this change happens extremely fast. To determine
which line goes earlier to low you have to use machine language
(assembler), BASIC is too slow. Writing a mouse-routine you'll
probably have to consider another point: you'll have to synchrinize
with the mouse first. That means first wait until both lines (1&2)
are high (1) and than determine which line goes to low (0) first.
Then you'll know to what direction the mouse has been pulled.

Please note, to write this description I have been using only
my lousy memory not a single written note. Therefore it will be
highly possible that the descriptions of directions the mouse is pulled
to in the above text are not accurate.

I hope you got a vague idea on how it works.
If there is some interset I'll look it up and post a complete
describtion in a week or two (or three :-))

This is me again. I have a message I made over a month ago. its my reply. Ive posted it via NetMail but from what I hear it might have not gone thru. I also accidentaly posted it in the FidoNet. Anyhow, im just going to put it in this message.

here it is:
I did'nt realize you made games
for various magazines. Ill try to
look for those magazines.

Im in the process of making a
Player/Missile editor myself. Its
comming along fine. The editor
itself works great. all I need to do
now is write a functioning main menu
and change the editor to allow
multiple images (for animation).
this will be a usefull program
because the editing is done on the
P/M'S Themself thus allowing
creation of any P/M combination and
overlap. No character set maker can
do that. I plan to keep this program
for my own use when its done. maybe
after awhile Ill release it as PD.

Id be interested in any tips you
could give me for game programming.
Someone with your experience and
backround aught to know alot about
using DLI's, VBI's, and scrolling.
I dont have a specific question
but ill think of something later.

By the way, my P/M maker program is
in 'Action!'. Thats what im using
mostly. Recently, at my club I got
'Atari macro assembler'. I hav'nt
used it yet but I only bought it
cause there was a book with it that
I really wanted. It was cheap too.

Bye.

Now, since I made that message, I already did the main menu and such. just so you know

Sorry it took so long to send it. The BBS im on is privately owned so LD charges for sending NetMail is comming out of his pocket. it will just have to be public for now on.

bye

2003. An alternative way to pay for Digi-Studio!

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-21 11:54:15 UTC
From: djg0@aber.ac.uk
Message-ID: <1992May21.115415.24698@aber.ac.uk>
Source record: 111200

Forgot to mention this yesterday, but there is one more way to "pay" for Digi-Studio.

One thing I do over here is swap old unwanted commercial software for PD from my library. That way people can get PD, and I can make the commercial software available to people who might have more use for it.

I would be willing to exchange copies of Digi-Studio for any software you may want to get rid of, especially stuff not usually available in the UK. If you have some you might like to exchange for Digi-Studio then please mail me with details of what you have.

Dean Garraghty. djg0@aber.ac.uk

2004. Re: The Atari Mouse on an 8-bit

Newsgroup: comp.sys.atari.8bit

Thanks for the information, guys.

I can see that BASIC programming for the mouse is out of the question,
though I would be curious to see the assembler code Marek mentioned.

Next week, I get to try and recreate the circuit diagram of the mouse.

2005. Fancy Fonts & Networks

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-21 17:02:51 UTC
From: dh108@cs.city.ac.uk
Message-ID: <1992May21.170251.26289@city.cs>
Source record: 111202

The text that follows after the cut line is the blurb that accompanies my fancy font routines that I submitted to one of Dean Garraghty's News-disks. You'll find the software on news-disk issue 2 at the atari.archive, however the document had to be re-formated to 40 columns which didn't do it any justice and so here's the original. Have no fear, I'm writing an 80-column document previewer so that it'll be used on future news-disks. It uses the routines similar to those described below, but in mode 8. You know the thing, 2 characters per byte.

The reason I'm posting this is that no-one has mentioned my routines to Dean and my ego is flagging <grin>. Nope, just curiosity really, they're so simple to use - someone must be able to make use of them.

The other reason concerns a question I have about linking multiple 8-bits together. Can you point me to any useful sources (journals, magazine articles, college projects perhaps) that describe networks of Atari's. I know that they were quite popular in schools at one time, but were they used as stand-alones, or can you have many 8-bits linked to a server (I'd like to use my Atari STE) with them downloading software when required (Ethernet?). If needs be, I could probably write (and would like to write) the software for tranferring data from the ST into the memory only one of a group of 8-bits, but the I'd like help on the way the network should be set up.

Thanks,
Mark.

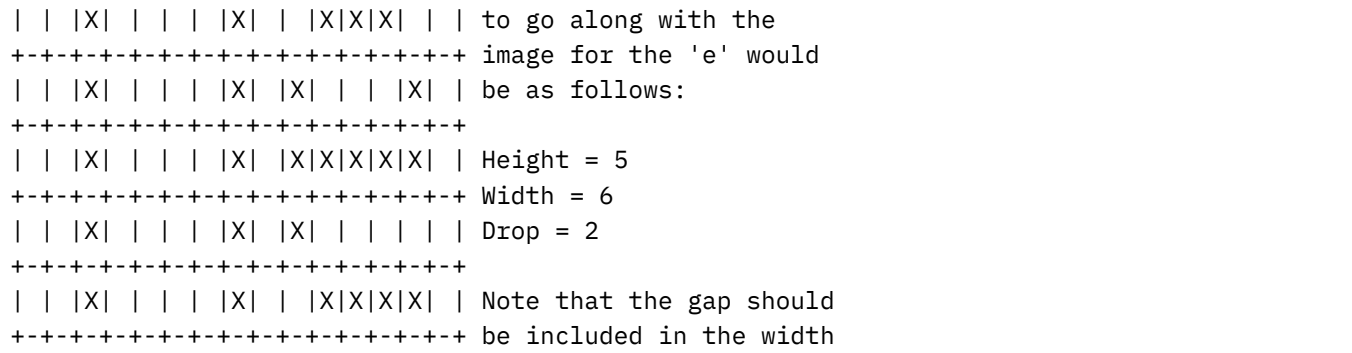
------------------------------* snip *------------------------------

FANCY FONT DISPLAY ROUTINES

For so long now people have been after text display routines for graphic modes 7 & 15. These routines have been provided, but they always use a block copy technique which uses a standard 8 by 8 bit character set.
My routines throw away these principles and allow the programmer to define the individual characters in terms of their image, width, height and drop.

Example: The word 'Tie' might be displayed as follows

```
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
|X|X|X|X|X|X| |X| | | | | | | |
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
| | |X| | | | | | | | | | | | |
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+ The accompanying data
```



| | |X| | | | |X| | |X|X|X| | | to go along with the
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+ image for the 'e' would
| | |X| | | | |X| |X| | | |X| | be as follows:
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
| | |X| | | | |X| |X|X|X|X|X| | Height = 5
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+ Width = 6
| | |X| | | | |X| |X| | | | | | Drop = 2
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
| | |X| | | | |X| | |X|X|X|X| | Note that the gap should
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+ be included in the width

This produces output which is more pleasing to look at. It's
difficult to do justice to this with words, so run the program
"D:EXAMPLE.BAS" to see what is possible.

HOW TO USE THE ROUTINES FROM BASIC

For ease of use, the routines are loaded upon booting the disk,
the program being in an AUTORUN.SYS file. The code is loaded above
DOS, then it protects itself from SYSTEM RESET by altering MEMLO and
DOSINI addresses. The routines and example font (Taken from the ST
game 'Paradroid 90' which inspired these routines) take up ~7.5K but
this still leaves you with ~30K available for your BASIC program.

There are 4 routines that you can use. In order to do this it is
best that you set up the following variables within your program.

e.g. 10 MESSAGE=7459:REM Address of Display routine vector.
20 SETXY=MESSAGE+3
30 COLOUR=SETXY+3
40 DRWLET=COLOUR+3

Definitions for each of these routines now follow:

SETXY

Format : A=USR(SETXY,xpos,ypos)
Limits : 0 <= xpos <= 159
0 <= ypos <= 191 ; for graphics mode 15
0 <= ypos <= 95 ; for graphics mode 7

Desc. : this moves the current printing position to the coordinates
(xpos,ypos). Important note - a SETXY must be executed
before any printing is done (i.e. a MESSAGE or DRWLET).

COLOUR

Format : A=USR(COLOUR,col)
Limits : 0 <= col <= 3 (Although MC routine will force any
value of col to be between 0 <-> 3)

Desc. : Sets the output colour as follows -

0 = COLOR4 (location 712) (Background)
1 = COLOR0 (location 708)
2 = COLOR1 (location 709)
3 = COLOR2 (location 710)

DRWLET

Format : A=USR(DRWLET,ASC("A"))
A=USR(DRWLET,char)
Limits : 0 <= char <= 127

Desc. : Outputs the character at the current screen position (which
is updated accordingly). Spaces are always drawn in
COLOR4, leaving the background intact.

MESSAGE

Format : A=USR(MESSAGE,ADR(M$))
A=USR(MESSAGE,ADR("An Example!"))
Limits : Last character of string must be inverse.

Desc. : Displays the string on the screen at the current x,y
position. The last character of the string must be inverse
(in the example the '!' is inverse) in order to denote the
end of string within the display routine.

ROUTINES FOR USE BY THE ASSEMBLY PROGRAMMER

Calling protocols are different within assembly language:

```
SETXY -> LDX xpos
LDY ypos
JSR POSITION

COLOUR -> LDA col
JSR SETCOL

DRWLET -> LDA char
JSR ONELET

MESSAGE -> LDX # >string
LDY # <string
JSR DOMSG
JMP skip
msg
.BYTE "An Example!" (Remember '!' is inverse!)
skip
... your code continues here
```

Assembler/Editor users must remember to replace all '>' and '<'
symbols as follows:

```
# >name becomes #name/256
# <name becomes #name&255
```

If your including these routines in your own program then you
can delete all the MEMLO initialisation code (lines 1014 to 1078),
otherwise assemble it to an AUTORUN.SYS file using the command:

```
ASM#D:FFDR.SRC,,#D:AUTORUN.SYS - Ass/Ed

ASM#D:FFDR.M65,#-,#D:AUTORUN.SYS - MAC/65
```

N.B. MAC/65 users should first load the source file using

```
ENTER#D:FFDR.SRC
```

then save it in MAC/65 format using

```
SAVE#D:FFDR.M65
```

The file "D:FFDR.SRC" can then be deleted, saving disk space.

DESIGNING YOUR OWN FONTS

Designing your own font is just as easy as designing your own
8*8 character sets. Let's go through an example - a lower case 'g'

```
|
+-+-+-+-+-+-+-+-+
| | | | | | | | ^ Drop = 2
+-+-+-+-+-+-+-+-+ |
| | | | | | | | v
+-+-+-+-+-+-+-+-+
| |X|X|X| | | | = $3F00 ^
+-+-+-+-+-+-+-+-+ |
|X| | | |X| | | = $C0C0 |
+-+-+-+-+-+-+-+-+ |
|X| | | |X| | | = $C0C0 |
+-+-+-+-+-+-+-+-+ |
| |X|X|X|X| | | = $3FC0 | Height = 7
+-+-+-+-+-+-+-+-+ |
| | | | |X| | | = $00C0 |
+-+-+-+-+-+-+-+-+ |
|X| | | |X| | | = $C0C0 |
+-+-+-+-+-+-+-+-+ |
| |X|X|X| | | | = $3F00 v
+-+-+-+-+-+-+-+-+
|

<---------> Width = 6 (Remember to include gap!)
```

Remember too that in mode 7 & 15, each pixel is two bits wide,
giving four possible colours. So define the character for colour 3,
i.e. both bits set per pixel, as the draw_letter routine simply
AND'S it with the current colour mask to produce the right colour.

This is also why the image is two bytes wide, to allow for characters with widths up to 8 pixels wide.
The data image is stored in the source listing as follows:

```
1000 LG
1002 .DBYTE $3F00,$C0C0,$C0C0,$3FC0,$00C0,$C0C0,$3F00
```

All the characters are referenced in the character table (see CHRTAB - line 1574). This is best left alone, and you should use the same labels for your images.
All that's left to do is to store the height, width and drop information in the correct positions in the relevant tables. So for our example:

Height = 7, Width = 6, Drop = 2

These are stored in position 4 of lines 1656, 1686 and 1716 respectively, corresponding to the LG entry in CHRTAB.

Hope that's enough for you to be able to do your own thing, if you have any queries, or just want to discuss programming on the 8-bit Atari, then write to - Mark Keates, 24 Hayes Mead, Holbury, Southampton, Hampshire, S04 1JZ, England.

Enjoy!

Source record: 111259

Your right, there are alot of new Atari users out here who DESERVE to hear the whole story. To give or not to give a break does not apply here, just the facts ma'dam. The fact is there are two revisions of the MIO available, and that users should know this. They could have been informed of this by typing just a FEW lines, informing them that the article pertained to the rev 1 MIO. Passing information is one thing, passing accurate information is another. I prefer the latter, and I feel that is the kind of information users (old and new) should be receiving. If this upsets you, I'm sorry, but those are my honest feelings.

What I will do at my next user group meeting is talk to a person who turned a 256k MIO into a 1 meg mio (something ICD said couldn't be done), so I can get a more technical explnation as to the changes made and get them translated so that non-tech orented people can understand what is being stated, and will write out the article myself.

What you stated about the article is true, however, I still feel that there could be (and should be) a footnote or some kind of statement stating which version of the MIO was being refered to, the fave that there are two different MIO's, and that the article hasn'T been updated since the indroduction of the rev 2 mio.

Well...if the mouse works anything like the trakball, it should send a direction, as well as pulsing some other bit somewhere (I didn't go over the article posted a while ago very well) which would tell you the speed. BTW: is this an "Atari Mouse" as in ST or 8-bit? I'll take it ST since the right-button don't work....

This brings up a good question. Remember "Indy 500" for the 2600. How did THEY work!? (I MIGHT actually have this info.SOMEWHERE in my collection of old _Atari_Age_ magazines). Bill

Are you sure? Did the same people who made Diamond GOS have a little teenee bit to do with GOE? In one of the .TXT's from the GOEDEMO.ARC one of the major programmers of GOE was stating that the company that releases his (HIS) Atari Cookbook was GOING to work with him on GOE but then broke a contract or something...that really pissed him off. I was just wondering if this IS the same company that made Diamond GOS. Did you mean GOE when you said that? This is pretty interesting. To bring up a question I posted earlier (and NEVER GOT A RESPONSE TO! :^[..) - is the FINAL (cartridge version) of GOE out?? How is it? The demo.SUCKS - but this is only because it does absolutely NOTHING. I think the final product might be pretty cool. Well? Anyone? Anyone?

I always wondered this too. I wonder, who else out there has seen TRUE (NOT APAC, though that looks mighty nice) 256 colors on the screen? I did this with a multiple DLI to split the screen into 16 colors downwards, and have drawn on the screen 16 shades (GRAPHICS 9 mode) horizontally. That's about THE only way to do it to view the SYSTEM'S colors. I just started thinking of some strange page-flipped screen-stacked waste of memory way of doing APAC without really doing APAC.. hehe...this is confusing me! humm.... I suppose there would be far too many screens to flip without getting MAJOR flickering. I was thinking of maybe having 16 screens, I guess. Each having a different color and being in GRAPHICS 9 mode. Naw.. ColrView does that much better with only 3. I guess my mind is VERY abstract! :)

2014. News-Disk

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-22 11:15:07 UTC
From: djg0@aber.ac.uk
Message-ID: <1992May22.111507.13316@aber.ac.uk>
Source record: 111261

Each news-disk contains a copy of XR_40.OBJ which loads in an unformatted file and splits it nicely into pages. Also on each disk is PRINTER.BAS a not too advanced program to tidy up unformatted text and print it in 40 or 80 cols. Your best bet is to load the text files into a W/P and print them out that way. If you're just reading them on the screen use XR_40. Each disk boots up with a cover screen telling you what's on the disk (issues 4 and 5 also have speech introducing the disk!) Then on each disk you have text files (articles etc) some have picture files, some BAS files, some COM files, and various other formats. Hope this helps!

2016. P:R: Connection for sale

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-22 13:44:20 UTC
From: jewison@aurora.physics.utoronto.ca
Message-ID: <1992May22.134420.4634@helios.physics.utoronto.ca>
Source record: 111263

OK, people, I've finally decided to unload my currently unused P:R: Connection.
I'm sure that most everyone on the net knows what a PRC is, but for you
neophytes the PRC is an interface which plugs into the serial port on the
Atari and gives you two RS-232 serial and one Centronics parallel port.
My reasons for selling it are:

1) My modem has been usurped by my 386 AT.

2) So has my printer.

3) I'm getting a Black Box.

It's in great shape (so is the manual) and includes both the modem cable and
the printer cable. Also included is the accompanying disk (from ICD) and
I'll even throw in my own disk with Bobterm 1.20.

Asking price is US$50 including shipping anywhere in North America.

This is an answer to your question about APAC-> APAC is a G.I.F.
decoder. It decodes ST and IBM .GIF pics so they can be displayed
on the 8bit atari. Used in conjunction with COLORVIEW 2.5 viewer
it produces some outstanding pics...it page flips (I think)
between 3 files...1 red, 1 green and 1 blue. Naturally the best
picture when using a color monitor (RGB).

> articles on hardware modifcations.

Hum...it WOULD be cool to have a section on it, though. Perhaps there could be something like "Game of the Issue," "Hardware Hack of the Issue," "Application of the Issue," and whatever else (like "Help!," "Bugs," "Editorial Comments," "8-bit Community" (that would be nice for updating us on who's just came into or left 8-bit support...or what new developments are up)...etc.etc. Yeah, I'm sure all of us out here and "at" A.C. would be able to come up with at least >1< thing for each section every >2< months! We aren't THAT busy! heheh.

(notice the "at" in quotes above... it WOULD be nice to see a little office with ..... ah nevermind. I'm just dreaming now! :) .. reminiscing that day I visited out favorite company's Sunnyvale headquarters! :) ... got some bumperstickers....oh!)

This brings into mind that neat idea that Sega came up with... the "C"
button registers as one of the paddle ports. I'm not sure where the "A"
and "Start" ones go, but when I get (IF I get) a Genesis controller, I'll
disect if for ya'll. :) Bill

Speaking of Quick being easier to find and stuff.... it was a magazine article (set of them, I'll suppose), correct? If so, then it's a disk-based language. THAT's cool. (I really like disks better for some reason..!? - price I suppose! :)) Anyways... where can one GET Quick!?!? And for how much? I might just try Dean Garraghty's idea about mailing German cash rather than an IMO. Humm... (IMO=internat'l money order AND in my opinion. I wonder if BTW means anything else!? hehe)

If you are an Action! programmer, I'd like to hear from you.

I've heard Action! described as some sort of cross between C and Pascal.
I'd like to hear just how Action! compares to other, more standard
languages.

If it is unique and complex enough, I may be able to study it for my
comps (integrative excercise, at Carleton College).

I have the source to a scheme interpreter lying around here. It's in pascal. If I could get a good pascal compiler I might port scheme (and a smalltalk variant) to the atari.

re:Bank Street Writer

I am not sure if the software you are using does this, but PRINTING to a FILE may work, also look around the software for an ASCII save routine. It is also possible for yu to write a simple BASIC conversion utility if you know the character it substitutes.

>
> Anders Skelander

Well.. Both.. sorta. Jeff Potter made APACView (as well as ColrView which is a memory hog, but lets you view 4096 colors!!!), so it's SORT of a product. I believe that Technicolor Dreams, which uses 256 colors, uses APAC (somebody PLEASE correct me if I'm wrong because I'm going to buy a copy of it..if it's NOT APAC, no thanx!).... but, from what Jeff said in the APACView .DOCs, the technique was first discussed in Antic (I think..)

Michael,

Here is the mouse handler supplied by zobian controls. I disassembled
it for you. I can't send binaries from the system I am connected to
else I would have sent the object code as well.
If you still need it, let me know and maybe I can mail it or something.

It is only 255 bytes, maybe I could turn it into a basic program
or data numbers that creates the obj file.

At the end of the source listing is a sample basic program showing how
to read the mouse x and y values. I pulled this from their basic
program that is their painting program.

If you have a chance, please post this to comp.sys.atari.8bit
for others that are interested, I am having problems with it right
now.

Jeff McWilliams

For those students out there, if your library has inter-library loan,
you can get copies of Antic articles (usually free). Antic is listed
in the microcomputer index if you don't know the page numbers, author,
etc.

I don't think so. From what I remember there was a demo for GOE that actually looked VERY good. It was about ready to be released, and then something happened and the author gave up on it. Alan Reeve was his competition, with Diamond GOS, which was a completely different product. I don't remember why, but I really wanted GOE to be released, and Diamond seemed inferior. I'm sure there's a copy of the GOE demo around somewhere.

There as also another 'GUI' which simply used ATASCII characters to draw its windows. I don't remember which one this was.

The people who wrote the Cookbook were looking to distribute either
the GOE package, or the Diamond. These two packages were written
by two different authors. After they broke off their deal with the GOE
author they made a deal with Allan Reeve for Diamond, but I understand
that didn't last long either. GOE NEVER was released, Diamond was.
I think I answered that question before, maybe you missed it.

>
There are public domain versions of the RUNTIME, and I am not sure,
as I don't have a hold of the official ICD runtime package just yet,
but I believe you can distribute an Action! program with the runtime
package appended to it. But I might be wrong here.

If Quick is disk-based, then some sort of callable library of routines
probably needs to be included to make the program run. I suspect that
it works similar to Faster Than Lightspeed C, where is it appended to
the compiled code.
It seems logical that as with Lightspeed C, once the RUNTIME is appended
you can freely distribute the program... that is the way it worked
with the C package.

2044. Disk Desk

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-24 20:24:02 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <R7oaLB3w164w@cyberden.uucp>
Source record: 111293

Gee... I guess it WASN'T here that I posted about Disk Desk... anyways:

I'm currently working on a little DOS interface (in TurboBASIC, of course, because I don't HAVE anything better!! :) - but don't worry.. I might be able to get my hands on Action! for VERY VERY cheap hahaha in your FACE! sorry... ego trip!) ANYWAYS..back to Disk Desk. I ALMOST made it into a point/click environment, but I decided that if I did that, I'd be obligated to make it support all those OTHER controllers (I only have joysticks and some really screwed up paddles (don't buy controllers from TeleGames USA! They tend to want to send a "left" (aka Paddle 1 fire) after about a week of use. pissed me off!!!)). Any of you who've seen Sparta DOS's menu'll regocnize my setup. It's not a menu where you type stuff, and it's not a CLI. It looks something like this:

```
Disk Desk By Bill Kendrick 1992
---------------------------------------
Drv: 1 DOS: At2.x Srch Help
Vol: Srt: None Cmpr Exit
Dir: *.*
Dir. Copy Lock Ers Ren.
Dir< Dir= Dir> Fmt Run@
GOD! gotta go!
I hate call waiting!

____________9_year_veteran_ ||| __
PhBill: Bill Kendrick / | \
moon!cyberden!phbill@well.sf.ca.us
---------------------------------
```

2045. Re: Disk Desk

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-24 20:39:34 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <NwPaLB1w164w@cyberden.uucp>
Source record: 111294

BACK to what I was saying before I got rudely interrupted!...
Here is what the commands do:

Drv: changes drive # (1-9)
Vol: shows/allows you to change volume name (w/ sparta dos)
DOS: allows you to change DOS directory output (lets you choose
Atari 2.x, MyDOS x/3 (those 2 are identical), MyDOS x/4 (has 4
digits) and Sparta (has 5 digits).
Srt: Allows you to sort by name, extender, file size, and time/date ot
have no sort at all.
Srch Allows you to search all avaliable directories for a file/files.
Cmpr Allows you to compare two files on a disk...or two files on two
disks.. just incase you have duplicates that you don't want.
Help That will print some sort of help info.
Exit I wonder! Lets you reboot/go to DOS/go to TurboBASIC
Dir: Shows you what the current subdirectory is, as well as the direc-
tory mask (*.*, *.COM, etc.). It is changed by the directory
movement commands, or can be changed manually.
Copy Copies (a) file(s).
Lock gee...
Ers aka delete
Ren. rename - it will even let you SAFELY rename more than one file
Dir< move out of the current directory into it's parent
Dir= create a new directory
Dir> move into the selected directory
Fmt format aka initialize disk
Run@ run at address

Later I'll add a Tree command (which would produce something like):
DOS SYS
DUP SYS
PROGRAMSDIR
GAMES DIR
PACMAN
JOUST
DEFENDER
UTILS DIR
TYPEIT
PRINTIT
MODEMIT
DISKDESK
DDIII DIR
NLQ DIR
POET NLQ

```
ROMAN NLQ
PP COM
FE COM
FU COM
TEXTS DIR
DEARMOM
DEARDAD
TOWHOM
HOMEWORK
AUTORUN SYS
AUTOEXECBAT
STARTUP BAT
1234 FREE SECTORS
----------------------
```

Get the picture? I'll also add printer support and possibly a LOAD command. BUT..for now, all I want on my hands is what I have way up there in this message. Also- all the commands are controlled with cursor-keys. Without [CONTROL] moves you thru the menu. With [CONTROL] moves you up & down the directory. [SPACE] flags files, [RETURN] executes menu commands. It's all pretty straight forward. Have I wasted enuf time babbling about this? I can't seem to get TurboBASIC to load in SpartaDOS 3.2d. Will they just not work together? I might just totally remove all spartados extras (like volume) out of the program. Does TurboBASIC work with the SDX cart?? (not as if I'm going to GET one! I don't use SD as it is! Too hard to use (guy lost his instructions! boo hoo!) and the only reason I keep it is because OasisJr doesn't seem to like MyDOS or AtariDOS too well. I dunno!

Heelllp! Comments? Questions? And yes, it stays
crunchy, even in milk!!!
Bill

Source record: 111288

>Are you sure? Did the same people who made Diamond GOS have a little
>teenee bit to do with GOE? In one of the .TXT's from the GOEDEMO.ARC one

FOUND IT!! It was sent to me on the 30 Apr 1991 so the information about
where to get it from may well be out of date by now.

From: Alan Reeve <t90chai@mp.cs.niu.edu>
Organization: Northern Illinois University

Here is the info that you requested regarding our Diamond GOS GUI
interface. Diamond GOS 3.0 is REEVEsoft's most recent version of the
Diamond GOS cartridge and it adds several new features to previous
versions. Diamond GOS is a complete graphical operating system for the
Atari 8-bit computer with a minimum of 48k. It allows for multiple,
moveable, sizeable windows, dialogue boxes, drop-down menu selections
via a mouse pointer, icons ... etc. just like on a Macintosh(tm) or
Atari ST(tm). The Diamond GOS package includes a 64k piggyback (other
cartridges can fit into it) super cartridge along with various
utilities, Diamond Paint, and Diamond. The package retails for $US69.95
and is available from various 8-bit dealers throughout the country as
well as direct from:
REEVEsoft
29W150 Old Farm Lane
Warrenville, IL 60555
(708) 393-2317)

SPECS:
* Suports up to 4 windows simultaneously (Diamond DeskTop uses 2).
* Works with DOS 2.x, SpartaDos (and SDX) and DOS XE.
* Supports the use of a joystick, keyboard, touch tablet, or ST mouse.
* Fonts can be up to 24 by 24 in size for Diamond applications.
* Supports up to 16 Mbytes of memory(current drivers support 256k).
* Environment completely programmable (Diamond Develop sold separately).
* Includes full features paint program for drawing freehand, lines
circles, ellipses, boxes, fills, mixing colours, magnify, mirroring,
cut & paste, import pictures, mixing text with a picture...etc.
* Includes full featured word processor that generates a WYSIWYG
output, mixing any of 8 different styles in your document, using any
font for your document, search & replace, cut & paste, justification,
80 columns without additional hardware....etc.
* Desk accessories.
* Diamond DeskTop built into ROM supports all DOS related tasks such as
renaming, copying, & deleting files & launching programmes (including
those that do not utilize Diamond).
Additions in Diamond GOS 3.0 over 2.1

* Faster
* Automatic DOS detection.
* Built in File Selector dialogue box (external programmes are smaller).
* and more...

For more information Diamond GOS was the cover story for Antic Magazine. Other Diamond GOS products available right now include Diamond News Station, Develop, 2 PD disks of Diamond based applications (also available via GEnie), and we publish a quarterly newsletter for Diamond GOS owners. If you have further questions please contact the above address.

==========

If anyone knows if the above address is still correct please let us know as I'm not sure whether REEVEsoft is still in business.

2050. Sources for cable, modem?

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-25 00:11:30 UTC
From: ASMJC@ASUACAD.BITNET
Message-ID: <92145.171130ASMJC@ASUACAD.BITNET>
Source record: 111303

Does anyone know of a place that sells Atari 800 IO cables? Also, I am looking for a source for a 1200 or 2400 baud modem. I could kick myself for not taking advantage of sales on an Atari 1200 modem which I saw in DAMARK and Best Electronics. They were selling the modem for under $ 30. Any similar deals still being offered?

Michael

2051. Re: Pt 1/2: Blackbox/MIO comparison

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-25 01:13:56 UTC
From: ab588@yfn.ysu.edu
Message-ID: <1992May25.011356.4198@news.ysu.edu>
Source record: 111296

I have had a 1meg MIO since 1986... the 1st two burned up in a
very short time. The 2nd one was replaced by version 1.1 on
Apr.16, 1987 and it has been running ever since that time 24 hrs.
a day with short interuptions for installing my hard drive and
brown outs and storms. It has not given me one bit of trouble.
Although, the BB is well supported (and that's the thing I will
definately get when mio goes) the fact that the MIO has 1 meg of
memory makes it a real tool especially with SNAPSHOT 3.0D.
SnapShot 3.0d is a program that takes a snapshot of the entire
memory of the computer and saves it in 65536 byte files. What
this means is you can run up to 10 different programs and SWITCH
BETWEEN THEM WITH A KEY STROKE. It also keeps the correct time
if you are running Oasis 4.7 BBS so that I can go to Textpro4.6xe
with a sh^8, then go to Bobterm1.22 with sh^7, then back to the
BBS with sh^4, and a CGS editor with sh^9 etc, etc, etc.
SnapShot 3.0d was originally for hd use but the hard drive
switches took 5 or 6 seconds. With the files stored in the MIO
the switch only take 2 seconds.....if someone rings the phone
I press sh^4 and everything is saved on what I'm working on and
it catches the ring for the BBS ..neat huh!

Hmmm!!! Wow. My friend from UC Berkeley is going to lend me his scheme book for a while. Hmm.. That reminds me of another oddity a day or two ago. I got this program called BINVIEW (views Binary file header info- pretty neat...still didn't help me figure out why my BOB-Verter crashes with TurboBASIC tho!! :)).. anyways. Both the .COM file AND the .DOC file were 42 sectors (remember Hitch-hicker's Guide to the Galaxy. The answer to the question of "life, the universe and everything" was 42...) well..that was interesting...BUT...not only THAT, the number 42 is mentioned IN the .DOC file! And I quote: "...you can make sure you run it without having 42 different memory resident programs...". Check for yourself! It's 3/4th down the 1st paragraph!!! :) Suhc COINCIDENCES in my life lately!!!

Making 1050s run smoothing should be something of a necessity really. Plastic scraping along metal causes wear. To lubricate the guide rails, use some very high quality machine oil (like the stuff that came with the 1027). Put one spot on each rail. Now, either CAREFULLY move the head mech LIGHTLY with your finger back and forth to get the oil on all the rail, or run a sector copier program so that the head mech moves from track 0 right to the end. The oil will eventually start to wear thin, so every couple of months repeat the process, but remove the old oil with a cotton bud first. BE CAREFUL here!

Instead of machine oil I used a few drops of a TEFLON based lubricator
that comes in a Pen. It was from Radio Shack, and I think they call
it Precision Lubricator or something. Once I did that, and cleaned
the heads while I was at it, I can't even hear the drive head
stepping, even when formatting a disk. It's really nice and quiet.

No, as far as I know Quick always creates pure machine language.
It doesn't need a runtime package to run. Therefore you can sell what
you've created with Quick. Actually there is a commercial game on the
market programmed in Quick (compiled of course). I've a PD demo version
of this game. It's called 'Rubberball'. I'll upload it to the archive.
Look for it in the new directory. I'll probably name it 'Rubberball.arc'

> So...give us some details on where we can purchase "Quick" and how much
> does it cost? I REALLY think I want THIS! :)
> Speaking of Quick being easier to find and stuff.... it was a magazine
> article (set of them, I'll suppose), correct? If so, then it's a
> disk-based language. THAT's cool. (I really like disks better for some
> reason..!? - price I suppose! :)) Anyways... where can one GET
> Quick!?!? And for how much? I might just try Dean Garraghty's idea
> about mailing German cash rather than an IMO. Humm... (IMO=internat'l
> money order AND in my opinion. I wonder if BTW means anything else!?
> hehe)

Yes, Quick is definitely disk-based. The price is 39DM for the version
2.1 including documentation (in German). (about $25 ???).
There is also a disk-based 'Quick-Magazine' about programming in Quick
(again in German). They have released 12 issues so far. Each issue
costs 9DM.

As I said on the digest the only source I know for Quick and S.A.M.
is this German distributor. It is a small publishing company that
used to publish a magazine called 'ATARImagazin'. Now after a break
'ATARImagazin' again is on the line. Now it is a user supported
magazin in German, much similar to what AC will become some day. :-)
This distributor offers a wide range of Atari software and a few
hardware supplements.
How to order: for German customers there are three ways to pay for
the stuff
1) send cash along with the order (p&p included)
2) to supply a cheque + 4DM p&p
3) paying to the postman as your stuff is delivered
+ 6.50DM p&p

The distributor doesn't say anything about foreign customers.
Wait! There is one note on the ordering form I have: they write that

you can pay with a cheque(check?) +10DM p&p if you are abroad.
They don't say what kind of check.

I posted a snail letter on monday to the distributor to ask him
about other possibilities for American users to order software
We'll have to wait for the anwser. I'll inform you about it as
soon as it arrives.

Now the address of the distributor:

Power per Post
Postfach 1640
W-7518 Bretten
Germany
Tel. (code for Germany) (0)7252/3058
Fax. (code for Germany) (0)7252/85565

or Verlag Werner Raetz (Power per Post)
Melanchthonstr. 75/1
W-7518 Bretten
Germany

These two addresses are equivalent, you can choose the one you better
like. The distributor gives these two addresses. I don't know why.

2063. Mouse handler extra info

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-26 02:17:51 UTC
From: Jeff McWilliams <JJMCWILL@MTUS5.BITNET>
Message-ID: <92146.211751JJMCWILL@MTUS5.BITNET>
Source record: 111063

I just found a little slip of paper pertaining to the Zobian controls mouse handler that I had Michael Current post earlier. In addition to the previous documentation, be sure to execute an x=usr(off) before doing any disk based I/O, and then reactivate the mouse handler via an x=usr(ON) after your I/O has been completed. Good luck folks. If anyone has problems assembling the source code, perhaps I can write a quick BASIC program and LIST it and post it here.. as I posted in the original message. E-mail me if you need help.

I've spent a lot of time programming in Action! & it can't be beat. I took a 'C class at night & used Turbo C for my homework. I'd say Action! is easier to use & compiles faster. I spent enough time do'n Turbo to get an 'A in the class, but still prefer Action! My only complaints with Action! might be floating point access is only slightly easier then from M/L & it gets slow when you are compiling code blocks. i.e. I once did a program that had 3 gr. 15 screens included as coded blocks => 90k of source code. It took about 6 minutes to compile from ramdisk. This is still probably faster then a Turbo save editor/compile/link etc. Everything else goes so fast it's almost like working with a interpreter. It has most commonly use logical operators & control structures [DO ... UNTIL, WHILE <condition> DO OD, IF <c> THEN ... ELSEIF <C> THEN].

2065. some questions of my own

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-26 06:06:27 UTC
From: Jeff McWilliams <JJMCWILL@MTUS5.BITNET>
Message-ID: <92147.010627JJMCWILL@MTUS5.BITNET>
Source record: 111064

I have a few questions to ask the rest of you folk. Maybe you can help me out.

First, does anyone know if David Castell is still around? I am interested in knowing what the current copyright status is of Castell's Graphic Manager from The Analog 8-Bit Extra.

This leads me to my next question, does anyone have the 8-Bit Extra on disk that they would be so kind as to send me? I am currently typing in some of the code and boy is it a pain. I remember a time when that's all you could do is type in the code and use the checksum programs... but I would really like to save myself some trouble.

Next, does anyone out there own an ST or ST compatible mouse that is also fairly comfortable with electronics? I just successfully converted my Zobian controls RAT, which is an ST compatible mouse - into a functional two button mouse for the Atari 8-bit.
I found out that on my mouse, the right button would connect the Paddle 0 input to ground. Well this doesn't register anything on the Atari. So by putting a 33 K ohm resistor between +5v and the paddle input, the input normally reads about 15. When the button is pressed, the paddle input is brought down to ground. The Paddle reads 248 I think, er whatever the default unconnected value is.
So by detecting anything say greater than 50 , you know the right button has been pressed. But, before I publish this as any sort of mod for the 8 bits, I need some other mouse owners to corroborate with me to be sure that all mice are created equal in this respect.

looking at the joystick port, the pins are numbered like this:

1 2 3 4 5
6 7 8 9

pin 9 is pot AX, or Paddle 0

pin 7 is +5v
pin 8 is GND

You will need a continuity tester to follow the joystick connector pins into the mouse to see which wires are which.

On mine, the right button was simply a switch between pins 8 and 9

To that I added a 33K ohm resistor between pin 7 and pin 9.

Come to think of it, one could build an external adaptor if this works on every mouse, using two DB9 connectors and the 33K resistor.

That way the mouse could still work properly on the ST.

Well, any body want to check this out for me? I would certainly
appreciate it.

(-- BTW: I LOVE
that quote!! :))

Lemme see now. Well, I worked on a BASIC windows, as well as a
TurboBASIC (which for SOME reason or another wasn't as good!?!? :) MUCH
faster, tho!). I gave up on those and I don't think the 1 release I made
somewhere would've gotten very far. Anyways... there is an Action!
windows toolkit that I got ('course I wasn't aware there was NO runable
file, so it's pretty useless until I actually >GET< Action! !!!). It's
all ASCII (I think) and I COULD post it ... if I can find it. It might
have some inverse or control characters here or there, but to an 8-bit
it's just text. It sounds pretty neat. Can't wait until I get Action!
so I can try it out!! :)

Personally I think it's a dead issue and you're wasting time worrying
about it. GOE never saw the light of day, and never will. Diamond
has been released, but it does have bugs. You either live with them,
or like me you can put it on a shelf and be nastalgic about what it
really could have been.

You sorta are getting a feel for it...with the code number bit.
I've run into some people who didn't want their name used or disclosed
for anything but the campaign. Some user groups have policies where
officers can't distribute names and addresses. It makes sense and I
don't feel that bad about it. Campaign wise it just meant sending
the user group officer a bunch of kits instead of mailing them
individually. It was easier for me this way so I was not upset by
it. But I do agree it would be great to get in touch with other users
in the local area. Something to definitely think over at least.

Oscar Fowler is thinking of Castel's Graphic Manager (CGM) which
appeared in the Analog 8-Bit Extra. I just typed in the
object file and the icon editor last night, and modified the
Icon Editor to work with my two button mouse instead of a joystick
and spacebar. Works okay for doing quickie BASIC code testing and
maybe some graphics 0 based windows.

==========
Ok PHBILL (is that short for "phone bill"?)
SnapShot 3.0D was written by Tom Hunt of Closer To Home
BBS 419-368-4413. You can get it there or Bob Puff's
BBS 716-586-5545 or my BBS 216-545-4817.
It is shareware and he writes plenty of good programs for
the 8 bit.
I'd upload SnapShot3.0d to umich 8bit archive but I'm not
how to do it. I'll find out and then you will see it in the index.

After reading all the posts reguarding GOE, I went looking for the demo. Not only did I get a copy from the archive, but I also got the blurb file that seemed to go along with it. In that file, D.Sullivan indicates that something like 600+ people had prereg'd for the cart version.... So, my question, what ever happened to D.Sullivan (listed as inactive on GEnie), the GOE cart and the people who invested in the system.

I got a copy of the old Berzerk computer game for my XE computer recently. Unfortunately, it came without any manual or description, and I never played it in the arcades.

What am I supposed to do to get rid of the enemy that bounces in and walks through walls without being hurt?

I think the sampled speech is impressive. Is this the first game ever with sampled speech on a home system?

Is there anybody out there who could list the spoken messages, please? It sounds (to me) as if the voice is talking about an intruder. Who's the intruder? Is it me or the bouncing thing?

"Evil Otto" is his name, and his primary characteristic is that you can't get rid of him. He shows up when you've spent too long in a room; the objective is to destroy all the robots before Evil Otto comes.

> Is there anybody out there who could list the spoken messages,
>please? It sounds (to me) as if the voice is talking about an

You're the intruder. The messages are (from memory), "Intruder alert. Intruder alert." (before Evil Otto comes), and "Chicken. Fight like a robot." (if you run out of a room without killing all the robots.)

I forgot where the 6502 jumps on start-up, I believe it's something like 3 bytes short of the top of ROM where it finds a JMP to the start-up code. The start-up code checks to see if it is a cold start or warm start by testing the RAM flag. If the flag indicates the power was off then the computer goes through the entire initialization procedure [reset Pokey, PIA, check for a cart, try to boot drive(s), etc]. Warm start performs some of the same procedures, but uses a RAM cart flag to determine if a cart is there and jumps to whatever address is in mem $A-$B. A little foggy on this one so take it with a grain of salt <g>: The cart (XL/XE) has two bank present lines. If they are tied to the right logic level then the memory management chip (Freddy?) disables RAM for that 8K bank & selects the cart ROM. During power-up the OS stores values in the cart space & sees if it gets the same values back. If they aren't equal then it assumes it has found a cart. The OS then sets the RAM cart flag & proceeds to initialize the cart. Order may be wrong, but I believe it goes 1st see if the cart ROM flag allows for a disk or tape boot, if so then JSR to that. Then perform a JSR through the vector @ $BFFE in the cart, next JMP through the vector found @ $BFFA. 90% of the carts I've looked at just have the vector at $BFFE point to a RTS in the cart space so it does nothing.

2093. Re: Only 128 colours?

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-27 16:05:58 UTC

Message-ID: <1992May27.160558.12593@ge-dab.GE.COM>
Source record: 111094

To answer the original (?) question: all graphics modes except the GTIA ones (9, 10, 11) can display only 128 colors. The lsb of the intensity value is ignored, so only even numbers of brightness seem to work. You can display 256 colors in GTIA modes using display list tricks (like APAC) since graphics 9 can display 16 levels of brightness (the lsb is not ignored).

As Bill Kendrick noted, APAC is a technique, which I have turned into a product line :^). Technicolor Dreams does use APAC mode, but is saved in a non-standard disk format. APAC was first described in ANALOG, BTW.

According the Mapping the Atari the vector from $FFFa - $FFFf contain
the following vectors NMI, RESET, IRQ at $c018, $c2aa, $c02c.
However, according to Motorola Spec Sheets, any 8bit processor has the
RESET vectored at $FFFe-$FFFf, IRQ at $FFF8-$FFF9, and NMI at $FFFC-$FFFD.
I would go with the Mapping the Atari, as Atari 'customized' many of their
chips.

I've upgraded my 1050 with the 'Turbo Modul' (I think sth similar to the
US doubler) and now it makes less noise. The documentation included with
the 'Turbo Modul' says this is achieved by increasing the step rate of
the stepper motor in the drive.

I know some folks are still having problems getting the News-Disks, and others may not have got around to i
may not have got around to it yet, so there follows some articles taken from various issues (that's if the power holds up long enough, big storm here at the moment!).

Dean Garraghty. djg0@aber.ac.uk

2100. Sound Sampling article

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-28 15:38:24 UTC
From: djg0@aber.ac.uk
Message-ID: <1992May28.153824.1817@aber.ac.uk>
Source record: 111110

Sound sampling: what it is, how it's done, and how to get the most out of it.

By Dean Garraghty.

This article is split into two main parts. The first part will talk about sound sampling in general, and the second part will talk about samplers available for the Atari 8-bit, and how to get the most from them.

PART 1 - SOUND SAMPLING IN GENERAL

Many people talk about sound sampling (or digitizing) without really understanding what it is, and how it is achieved. This part of the article will hopefully clear this up.

Sound sampling is a way of converting real sounds into a form that a computer can store, and replay. Natural sound is in analogue form. Analogue means that something is continually changing, or to put another way, that it has no definate value. Sound waves are a subject on their own, but you should know that sound has a frequency. This frequency dictates the pitch of the sound we hear. This frequency is measured in Hertz (Hz). If the sound oscillates at 50 times a second, then its frequency is 50Hz, and so on. The higher the frequency, the higher the pitch of the sound. If you don't understand this, then don't worry. It's not vital to the article.

Analogue is obviously no good for a computer, as a computer needs definate values. A computer is a digital device. This means that it needs definate values (0s and 1s in the case of a computer). So what we need to do is convert our analogue sound wave into a series of numbers for the computer. This is done by a device called an "analogue to digital convertor", or A/D convertor as they are usually known.

An A/D convertor works by "sampling" the wave at regular intervals (in this case the sound wave). At each sampling it samples the wave and turns it into a number for the computer. It does this a fixed number of times per second. This is called the sample rate. A high sample rate means that the wave is sampled more times per second than a low sample rate. E.g. a sample rate of 16KHz means the wave is sampled 16,000 times a second. The following simple graph will show how an analogue wave is converted into digital data:

(I have a diagram of this in the form of a .PIC file on this disk. You can see it by running the program: SEEATOD.BAS from the menu)

This method of A/D coversion is called "successive approximation", because it keeps taking approximations of the wave.

Once the sound has been sampled, it can easily be stored in the computer's memory. How the sound is played back depeneds on the computer, but

in general it works like this:

The computer takes the data for the sample, and very rapidly "puts it through" the computer's sound chip. By making the TV speaker vibrate at the correct rate, a fairly close representation of the sound can be played back. How good the quality is, depends on the sample rate at which it was sampled. The speaker vibrates at the frequency corresponding to the pitch of the sound. I will explain how it's done on the Atari in the second part of the article.

PART 2 - SOUND SAMPLING ON THE 8-BIT ATARI

You should now know the principles of sound sampling, so I will now go on to talk about sampling on the 8-bit Atari.

You will now be wondering how sampled sound is played back on the Atari. Well, it uses a feature of the Atari's sound chip (Pokey) called "volume only sound generation". This is done by turning on bit 4 of AUDC1 (or 2,3,4). A speaker creates sound by moving a paper cone in and out. The force with which it does this determines the volume. Type the following from Basic:

```
POKE 53761,31
```

You will hear the TV speaker click. We have set bit 4 on, and set the volume to 15 (16+15=31). Now type:

```
POKE 53761,15
```

You will hear another click as the speaker retracts.

By using the volume, and bit-4, the computer can recreate the sound, by very quickly moving the speaker in and out.

Phew! That's got the heavy stuff out of the way! Now let's talk about some specific samplers for the Atari, and how to get the most out of them.

If you already own a sampler, then you should find the rest of the article of some use. If not, then you should consider getting one! (see later for details).

Quite a popular sampler for the Atari was "Replay" from 2-bit systems. I say "was" because it's not available any more. This is the sampler I use, and it creates good quality samples. If you own "Replay" then the following tips should come in useful:

A good sound source is essential (as with any sampler). Try and get one with a graphic equalizer (at least 5-band). Just keep adjusting each band until the quality of the sound is acceptable. Don't bother using the calibrate function. Just select Sample, and when the line comes on the screen, play your sound through for adjustments. The higher the volume you play the sound at, the more distortion will occur. So, keep volume as low as possible.

Replay will only allow you to sample as low as 6KHz. But what if you want more than 9 secs. of sample? The answer is easy. All you need is a tape

recorder with a high-speed dubbing facility. Simply "pretend" your copying a tape, and select the high-speed dub. on your recorder, and sample the sound at the high speed using a sample rate of 6KHz from Replay. Then when you play it back from Basic, use a play rate of 14. You should get about 14 secs. worth of sample. Some recorders will have a different speed for high-speed dub. Mine seems to play it at about 1 and a half times normal speed. If your's does it at a different speed then you will just have to experiment with different play rates. But note that the quality will not be as good, but should be acceptable if you were careful with volume and the equalizer. Another thing you may want to do, is to leave the screen on while the samples are playing. The screen has to be turned off to play the samples properly, but you can leave the screen on if you want (expect a severe drop in quality, though). You can do this by typing:

POKE 1597,10

after first loading the M/C player data into memory. The screen will now be left on during playing. If you want the screen to be turned off as normal, then just type:

POKE 1597,0

The following tips are for ASP users:

Antic magazine published the schematic diagrams for a digitizer in its Feb/March 1990 issue, and had the player and sampler software on its issue disk. It's called ASP (for Antic Sampling Processor). I haven't got around to building it yet, but the samples supplied with it sound of good quality. It comes with a Basic player routine, which can easily be altered to load Replay samples. You just have to take the bits out where it works out where to place it memory, and where it loads the header bytes from the sample file. Then just specify the length, etc. yourself. I have another tip for ASP users, but it won't seem of much use until you've read the next section on sound editing, so I'll tell you about it there.

2.1 - GETTING THE MOST FROM YOUR SAMPLER

Many people just use their samplers for speech, or just to sample a few seconds of music from a tape. Of course, you are very limited by memory, but by editing what you can fit in memory, you can create a good, long tune. This will require a bit of work on your part, but the result is worth it! Here's how:

You will first need to find some music that is fairly repetative (Jean-Michel Jarre and Penguin Cafe Orchestra are good ones). This is because of the limited sample space you will have available. You will want the result to sound something like the original, so it's useless trying to re-create something like a rap, where every bit is completely different!

Having found your tune, you should listen to it a few times, so that you can decide which bits are to be sampled. Make a note of these.

Now you should sample the bits of the tune you want. By sampling several distinct phrases of the music/song, you can play them in different orders and pitches to create quite an interesting song.

Having sampled the bits of the music, you should now work out where they start and end in memory (don't forget that you will be playing the sounds back from Basic, or M/C if you're really good!) Make a list of these.

You should now work out in what order and pitch you're going to play these in to create your tune. After doing this, you can now go on to write your program to play them.

I have done loads of edited sound samples. See my current PD list for details of these disks.

Replay owners: to stop the screen from flashing on and off during playback, simply have POKE 559,0 at the start of the program.

ASP owners: here's the tip I mentioned earlier. To stop the screen from flashing on and off during playback you will need to modify the M/C player routine. On line 850 in the PLAY.BAS program, change the 34 to a 0. Then you should have POKE 559,0 at the start of your program.

2.2 - SAMPLERS AVAILABLE

There are still a couple of samplers available. As mentioned earlier, ASP from Antic is by far the cheapest, but you have to build it yourself.

The other alternative is Parrot II. This is available from Gralin International. This is also a good sampler, and also has synthesizer capabilties. I haven't actually got this, but I have the PD demo disk for it, and it sounds impressive. Parrot is a little pricey, but should be worth it if you can afford it! I have the PD demo disk in my PD library. A copy will cost 2 pounds.

PART 3 - SUMMING UP

You now know how samplers work, and should be able to get more out of them. If you have any questions about sampling, then feel free to write:

Dean Garraghty, 62 Thomson Ave, Balby, DONCASTER, DN4 0NU.

(Please enclose a SAE if you are not ordering at the time).

2101. Replay sampler review

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-28 15:41:48 UTC

The Replay sound digitizer review

Article by: Dean Garraghty

You may wonder why I'm reviewing a product which I previously claimed was no longer available. Well, thanks to Gralin International, Replay is available again! I'm assuming Gralin are just selling Replay in exactly the same form as 2-bit systems did originally, because I'm writing this review about my Replay cartridge which came from 2-bit exactly 5 years ago!

Replay is a sound digitizer, used for sampling sounds of any sort. I discussed sound sampling on issue 1 of the newsdisk.

The Replay package comes with the Replay cartridge, a disk of software and a manual. The disk contains the sampling software, a playback routine for Basic programs, and also DigiDrum and DigiSynth, as well as a space invaders game (doesn't mention this in the manual!). The version 2 disk (which I think Gralin will be supplying) also has an echo program. More on this later.

Replay is quite different to other samplers on the Atari, because it does all the A/D conversion externally and then sends digital data via the cartridge port. This is a very classy way of sampling! A lot of samplers took advantage of the Atari's in-built A/D facility. But, the in-built A/D conversion technique is far from accurate. The Replay cartridge uses A/D chips to do the conversion, which means a much more accurate conversion.

Getting Started

The first thing to do, is plug the Replay cartrdige into the cartridge socket. This doesn't affect the running of the computer in any way. Next, you boot the sampling software. This is a binary load file on a DOS 2.5 disk. After loading a very classy looking screen comes up. The whole system is based around pull down menus. These are accessed by using the console keys. The options on the menu bar are: SETUP, WIPE, SAMPLE, PLAY, FILE, (C).

SETUP

Selecting this option causes a pull down menu to appear. This lets you alter the sample rate (6, 8, 10, 12, 16, 21Khz are available), switch between disk and tape storage, calibrate your input source (in other words, get all the controls set up to give the best sample quality), reverse the sample, and set trigger levels (this allows you to let the computer start sampling as soon as the sound starts on your input).

WIPE

Clears the sample from memory.

SAMPLE

Starts sampling from your input source. Also allows you to listen to the sound coming in before you start sampling.

PLAY

Plays the sample.

FILE

Allows you to load, save, and take directories of samples.

(c)

Displays a copyright message!

Using Replay

So, that's what it can do, but how does it perform?

Well, I've been using replay for 5 years now, and I've picked up a few bits and pieces along the way!

The input source can be anything which produces sound really. The replay cartridge has a wire coming out of it with a standard mono 1/4" jack on it. This will plug into a tape player, radio, CD player, etc. Of course, the sound coming in must be amplified in some way. It's no good trying to sample a signal from a CD player! Anything which has a volume control can be considered as being an amplifier. A graphic equalizer is also worth having in your source, or at the very least a good tone control. The input must be as clear as possible to get good results. As I mentioned earlier, a few different sample rates are available. 6Khz is really just for voice. 16/21Khz are needed for really good quality. But, samples take up large amounts of memory, and high quality samples need lots! Using 21KHz, only 3 seconds of sound will fit in memory! At 6Khz, about 9 seconds will fit.

The sampling software is very easy to use, but the constant use of the console keys soon makes fast operation clumsy. A straight-forward list of options would have been better. The middle of the screen shows a graphical form of the sample. This also allows you to do some editing on the sample. Two markers can be moved by using < > and + *. These are used as start and end markers. When you execute options from the menu, the action operates on the sample contained within these 2 markers. So if you used wipe, only the sample inbetween the 2 markers would be wiped, and so on. You keep experimenting with the markers until you have the section of the sample you

want. Then you can save the sample to disk. The voice sample on this disk was done using Replay, using a sample rate of 10Khz.

The manual is awful! No other word could be found to describe it! It really lets the system down. It comes as an A5 booklet, which looks OK, but the content isn't! You will need to experiment a lot after reading the manual, because there are lots of things which just don't make sense at first, especially if you are new to sampling.

The disk also contains a Basic program in LIST format, which contains a machine code player routine for playing samples in your own programs. This program also lets Replay down a lot, because it only lets you play back at the set sample rates. You can speed up and slow down the playback by pretending the sample was sampled at a different rate, but that's about it. Of course, the screen is turned of completely while playing samples, because of the Antic chip stealing the data bus for updating the screen display. The manual gives an example Basic program using the routine, which is nice, but the rest of the explanation makes no sense at all!

I mentioned earlier, the echo program. This just takes your input source and echos it at different speeds. Thing is, it is totally useless, because you can't store an echoed sample. It just sits there and echos the input. Really pretty guys, shame it's totally useless!

Also on the disk are DigiDrum and DigiSynth. DigiDrum is an excellent drum sequencer with lots of features. DigiSynth is a VERY simple music programmer, with a range of just 1 octave. Tunes can be saved and played with any Replay sample. These two programs are in the usual style, with pull-down menus.

The disk is finished off with a few samples, and a free space invaders game. Quite nice really!

Replay works on any 48K 8-bit Atari. It is very fiddly to get the cartridge into XE machines, esecailly when you can't see the port!

Conclusions

The sound quality of Replay samples is excellent. The software is very nice and easy to use. The manual leaves a lot to be desired! All in all an excellent sound sampling system.

Replay costs 34.95 (pounds) from Gralin International, 11 Shillito Road, Parkstone, Poole, Dorset, BH12 2BN, England.

2102. controller card review

Newsgroup: comp.sys.atari.8bit

```
ComputerHouse Controller Card.
------------------------------

Review by Dean Garraghty.
-------------------------

The Computer House controller card was available from Computer House in the
UK. Unfortunately, they ceased trading a while back. But, there are still
some of these things around, and you may (like I did) get one second hand.

What is the controller card?
----------------------------

The controller card is a small circuit board which was available for both XL
and XE machines. It required some soldering to fit. It also came with a
master disk containing various control software. More on this later. A manual
was also supplied.

The basic idea behind the controller card, was that special software could be
loaded and remain invisible to whatever software you were running normally.
This allows you to do some pretty clever things.

ComputerHouse calls the controller card the "Desktop Management System".

The Software
------------

Supplied with the controller card is a disk of master utilities. This disk is
double sided, but each side is the same. Side 1 is for printers with 216/n
variable line feed, and side 2 is for printers with 144/n variable line feed.

You simply put the disk in drive 1 and turn the computer on. You then get the
main dektop menu. From here, you can change system parameters, or load other
desktop utilities from the disk. This is what is available:

System character sets - you can choose from 14 character sets. Once you have
set the one you want, it will remain active until you finally turn the
computer off.

Control Panel - Lets you alter various parameters. You can turn auto scroll
on/off, turn noisy I/O on/off, turn the key click on/off, turn inverse flash
on/off, turn fast cursor on/off, change colour defaults, and alter cassette
baud rate. Again, these will all remain active until you turn the computer
off.

SuperDump II - this desktop utility is very useful. It allows you to stop
your main program and dump the contents of memory out to disk. This is useful
for software development, but is also a good way of transferring those
```

awkward tapes to disk, because this utility dumps the program AFTER it has loaded, therefore by-passing the muti-part tape load problem.

The O.S. boot menu - This allows you to convert Mutiboot menus to a menu which remains resident under the control of the controller card. This saves you having to keep loading the menu from disk.

400/800 O.S. saver - 400/800 owners are in for a treat here! If you load the desktop software into a 400 or 800, and then select this option, it dumps the O.S to a bootable disk file. Then you just boot this disk into an XL/XE with a controller card and the old O.S remains resident. Your XL/XE is now the closest you can get to a 400/800 because you have the exact old O.S in your XL/XE. This means you have to plug Basic in on cartridge. Also, the self test is replaced by the memo pad! This is the utilmate translator!

Snapshot printer dumper - another excellent utility for those of you with an Epson compatible printer or an XMM801. You install the printer dumper on your controller card and then boot a game or whatever. When you want to dump a screen to the printer, you just press the HELP key. The controller card takes over and freezes the program and dumps the screen to the printer. When it's done, the program just continues! The printer dumper has draft, SHQ I, and SHQ II modes. Draft seems good enough for me, but SHQ must be even better. Unfortunately, these modes don't seem to work on my XMM801.

Disk I/O analyzer - If you load this util in your desktop, any disk you boot will cause the controller card to send data to your printer, with the following details: disk status, command status, hardware status, memory location, sector, memory buffer, commands sent to disk drive, disk status, call addresses. Each sector read from the disk causes a line of data to be printed detailing what exactly is happening. This allows you to find lost or corrupted files. Holding down the HELP key stops it doing this.

Format disk - Formats a disk in non-standard format. Just used for the following option:

Save desktop to disk - this allows you to save your favourite set-up to disk as a boot file. This saves you having to keep selecting from the menu each time.

Direct exit - performs a cold start. This saves all the set-up details for you in the desktop, and then boots your disk in the normal way. You can also hold down START here as well if you want to boot a tape.

The control panel

The control panel is a set of little pins which are mounted on top of the computer. You have 3 little blocks which slot over the pins in various ways. This gives you extra control over the desktop.

Desklock - with this set, your own program is unable to re-set your controller card.

RAM mode - your program is allowed to re-set the desktop with this set. Mainly used if you want to write your own utils for the desktop.

Desktop on - with this set you can use the desktop facilities.

Desktop off - switches the desktop off completely. Computer now acts like a standard XL/XE.

Basic on/off - lets you switch Basic on and off.

You can also switch all these settings while your programs are running.

The manual

The manual comes as a pile of A4 sheets stapled in one corner. Not the most professional looking document I have seen. It also seems that the author didn't have a very good grasp of English! But, it contains everything you need to know, even if it is a little brief!

Problems

It appears that the controller card uses the 16K of RAM hidden under the O.S to store the utils you load onto it. This causes problems if you want to use SpartaDos X or Turbo-Basic or anything else which uses this same area. You have to turn the desktop off in this case.

Conclusions

The controller card is a technical piece of kit, which may not be of use to everyone. But if you see one available, grab it! The XL and XE versions of it are different, so make sure you know which it is for. Price guide: XL or XE card on its own - 20-25pounds, fitted in computer - 35-50pounds. Make sure you get the utils disk and manual. It's useless without these. Also, ComputerHouse released extra disks for use with the card. I have the 1029 printer dump. This is the same as the dump on the master disk, but this util dumps the screen to a 1029 printer.

2103. Re: C Package . . .

If you want to run up some LD$, I think the latest/greatest may be found on Atari Base (But it could'a been Full Moon???). Anyway; (408)745-2196. I'm assumming you want PD vs LightSpeed C. I D/L'd the thing to take a look at it & it seems more complete then any other package I've looked at. It DOESN'T have a shell, but I think it may even support structures & somehow figures out how to use a real bracket CHR$(125) instead of $($). REM: I haven't tried it yet so only opinions based on quick read of the docs.

2104. All Micro Show 5 report

All Micro Show 5 Report

By: Dean Garraghty.

Back on November 9th last year, the All Micro Show (AMS) 5 was held in Bingley Hall, Stafford. This venue has established itself as the main show for Atari 8-bit computers. It is, in fact, a general computer show, and electronics fare. But, the Atari 8-bit dominates the show.

I must admit that I didn't get much time at all to look around. I was too busy on my own stand (thanks to those who came and supported us). We were selling PD, used commercial software, used hardware, and Digi-Studio. Many people came to visit us during the day.

Other than us, there were the usual Atari exhibitors, as well as a few new ones. Page 6, Micro Discount, and BaPAUG/Gralin were all there as usual.

Page 6 was selling its huge range of software and books. Page 6 are at: Page 6, PO BOX 54, Stafford, ST16 1DR.

Micro Discount was by far the most popular stand (as usual!). It was crowded for the most of the day, and not suprisingly! How about a 400 for 3quid?! Derek had loads and loads of books/software/manuals as well. How about the complete Technical Reference Notes for a quid, or De Re Atari for a fiver?! Loads of Field Service Manuals were also available at a quid each. Micro discount are on 021-353-5730.

BaPAUG/Gralin were selling there usual stock items. Colin was showing off his 1400XL (I even got to hold it, for a few seconds!).
BaPAUG are at: BaPAUG, 248 Wimborne Road, Oakdale, Poole, Dorset, BH15 3EF.
Gralin are at: Gralin International, 11 Shillito Road, Parkstone, Poole, Dorset, BH12 2BN.

A new face to the show was LACE (London Atari Computer Enthusiasts). They were there gettin subscribers to there BOOT! newsletter. LACE also run a PD library of "the highest quality" (so there leaflet says!). They also have a dedicated menu on the City BBS (021-352-1237). They also are setting up there own BBS soon. LACE are at: LACE, 143 Richmond Road, Leytonstone, London, E11 4BT. Tel: 081-960-1605. LACE were going to have an advert on this issue of the News-Disk, but failed to get it to me by the time I specified (tut tut Simon!).

Bill Sutton (Late of XL/XE Alive) was there selling some reconditioned hardware and some software. He also had disk notchers at 2.50 each. Haven't seen those for a while! Unfortunately, I have no idea what address or phone he is operating out of now.

The rest of the show was taken up with other weird and wonderful computers, like the TI-99/4A, et al, and electronics and radio enthusiasts. Lots of bargains to be had here too.

As usual, AMS was great. Lots to do, and loads of bargains. Looking forward to AMS6!

This extra little bit here is just to embarrass Mike Blenkiron!!

Mike drove me down to AMS and also helped on the stand during the day. But, getting to Stafford was not as easy as we had hoped. 30 seconds onto the motorway out of Doncaster, we had a bit of trouble with the police! A police land rover started flashing its lights. We thought "it can't be us, let's drive on". So we did, and in fact overtook it! Then the lights started flashing again! "It can't be us, we thought". Then it over took us, and stopped us. Yikes, I thought! We got severely told off for driving with full-beam headlights on. I would just like to thank that policeman for being so lenient! We may never have got past Doncaster if he hadn't of been!!

I would like to thank Mike Blenkiron, Mark Keates, Paul Saunders, and William Todd for helping on the stand all day long, under extreme pressure and for no pay!

2105. Magniprint and Weak Review

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-28 15:58:30 UTC

GETTING IT DOWN ON PAPER

By Jon Cooper.

In past issues of New Atari User a lot of readers have wrote in asking about dumping graphics created with commercial software to there printers. So I decided to review two currently available programs Magniprint II and Weak! from the Page 6 P.D catalog. Can a P.D program possibly be as good at its job as a full price release..Read on!

MAGNIPRINT II

When Magniprint II is first booted up the first thing on the screen is the file conversion menu. Before any going any further you have to load in your chosen picture file and save it in Magniprint II format.

Files can be converted from all the following programs:- Micro Painter, Micro Illustrator, Paint, Fun With Art, B/Graph, Graphic Master, Super Sketch, Strip Poker, Movie Maker, Graphics Magician, Atarigraphics Lightpen, The Print Shop and Syngraph. As you can see not much has been missed out!

When you have converted your files to Magniprint format you then load from disk the main printer program. You then are confronted by a screen asking for the file name of the picture you want to load or you can list the disk directory. When the file is loaded it is shown on the screen. At the press of the space bar another menu is put up with various options on to enhance your picture. Touch up screen allows you to alter your picture using a joystick like the draw facility on Atari Artist. Add text lets you put writing any where on the screen, five character sets are on side two of the disk. Poster print lets you blow up your picture to wall poster size. When you have made any changes you want at a press of a button your picture is printed.
Epson and Gemini printers are supported.

I printed of pictures in Print Shop, Paint, Micro Illutrator and Micropainter formats using my Citizen 120D printer the results were fine but the program seemed to have a few bugs in it. Ever so often it would refuse to load a file or the whole program would crash. Even so Magniprint II is fairly easy to use and one of the best things about it is the amout of different software format files it can convert some of them I've never heard of. All in all Magniprint II is a good utility that does its job well.

WEAK!

When Weak! is first loaded a menu is put up asking you to chose between the main program and the documentation.
After Magniprint II I thought "Huh..Who needs docs on a printer program?"
So I chose to run Weak! big mistake!
The first thing that comes up after a few seconds of loading is a screen full of German. I managed to work out that you had to press space to carry on.
After a bit more loading a main looking menu is put up. I say main looking because the whole things in German.
"'Fiddle sticks' Ill have to load the docs after all!"
After reading the docs all is clear Im ready to tackle the menu again.
When you get the hang of it Weak! is really easy to use. Pictures can be loaded from:- Micropainter, Koala, Fun With Art and Stripoker. Unlike Magniprint files don't need to be converted they can be read stright of the disk.
Pictures can be printed in three sizes: Small Medium and Large. They can be printed across and verticaly down the page. Weak! can not edit pictures but the colours on the screen can be changed to give the best effect on your printer (I found strong contrasting colours worked best like red and green).
Pictures can also be displayed in graphics modes 8, 9 and 15.

Epson, Star LC2410 and Seikosha printers are supported but your own parameters can be keyed in but as the menu is in German this is a bit tricky!

I printed pictures in a number of ways and got exellent results. Weak! is first rate at its job and very easy to use. Dont be put of by th German it makes the program more interesting!

THE FINAL VERDICT

Both utilitys are good at there job but the main thing to think about is price. Magniprint II costs about twenty five pounds where as Weak! is only three quid!
My advise is to buy Weak! first if your happy with it fine, but if you need that bit more flexibility then upgrade to Magniprint.

MAGNIPRINT II is availible from GRALIN INTERNATIONAL price is about twenty five pounds.

WEAK! is availible from PAGE SIX public domain libary price is two ninety five. WEAK!s libary number is DS#60.

2106. DOS XE review

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-28 16:01:04 UTC
From: djg0@aber.ac.uk
Message-ID: <1992May28.160104.3322@aber.ac.uk>

DOS XE review, by Paul Allton.

DOS 2.5 was probably one of the most simple, user-friendly disk operating systems ever written. Which explains, in a nutshell, why it is so popular. But it certainly had its limitations - it was not terribly advanced, and made no provision for future technology and enhancements.

Fear not, because Atari's latest - DOS XE - is at last available in the UK. It works very well with any drive, but for despairing XF-551 owners (like myself) its arrival is a Godsend. At last, a DOS enabling full use of the XF, with double-sided, double-density formats - a total of 360K on a single disk. Also supported are the 810, 1050, and modified 1050s (with true double-density - 180K each side of the disk).

Into the drive with the disk, power on. As normal, the disk loads and you are thrown into Basic, with the familiar "READY" prompt. Then the first suprise - you type DOS and expect the drive to burst into life, but it does not. Instead, the DOS menu instantly appears on the screen - no more loading from a disk is necessary.

This is because DOS XE uses the familiar bank switching technique. This disk utility package is hidden under the operating system, and is simply switched into memory when required. This still leaves you 32274 bytes free in Basic. Any Basic program is kept intact while accessing DOS, without the need for a MEM.SAV.

The only disadvantage of this, is that software using the same area of memory as DOS XE will not work. Unfortunately, Turbo-Basic is one of these programs - a pity. But, I know for a fact that some people only use Turbo because they can't be bothered to go through all that loading and disk-swapping involved with going to DOS. For obvious reasons, DOS XE would be very suitable for them.

The next suprise - instead of the usual cramped-up screen, you are presented with a main menu with four options: File access menu, Machine language access menu, System function menu, and of course the obligatory Exit to Basic/cartridge (except when Basic is disabled).

File access is precisely what it sounds like. All the usual commands are there (directory, lock, unlock, delete, copy, rename, format, etc.), plus a few others such as appending and viewing.

DOS XE also allows sub-directories (with up to 360K on a disk, you'll soon see why!) So, options to delete, make, and choose the working directory are also included.

Moving on to Machine language access. This is another area where DOS XE scores highly over its predecessor. As in DOS 2.5 you can run/save binary files, and go to a machine language prog. (i.e. run at address), you may also append to a binary file, and load a binary file into memory without running it. The latter is particularly interesting because you can then display (and change) selected areas of memory. Each address is displayed in ATASCII and hex, rather like a disk sector editor. It does not really mean a lot to a novice like me, but I am sure more advanced users would find it very useful and interesting.

The system function menu has just a few options, as well as directory and working directory (available in all menus). There is also an "allow DOS 2.x access" option. When selected a small file is loaded and run. This allows access to DOS 2.x disks by using A: as a prefix, rather than D:. It is not a convertor program as such, you have to copy each file in turn via the DOS COPY option, from your DOS 2.x disk to a DOS XE disk, which is painfully slow. Some people would prefer a convertor program I am sure, but the menu says "allow DOS 2.x access" and that's exactly what it means. You can read a text file, run binary files, etc., without having to convert them first, which I personally consider to be more use.

For those of you unfortunate enough to have been using DOS 3, there is a program on the disk to convert files to DOS XE format.

At the moment DOS XE has no documentation files. The program itself is Public Domain, but the manual is copyrighted and cannot be copied freely. But it's not really needed - DOS XE is very easy to use. After ten minutes playing around you won't have any problems. Because all the commands have been changed (E.g. directory=files listing, delete=erase) you may be confused for a bit. This is because to choose an option you type the first letter and press return. But once you've learnt the new names, it's easy - a joy to use, and a great improvement over the old system. You can select what you want without having to look up at the screen, or re-printing the menu.

There are a couple more flashy features not mentioned yet, such as batch processing. You can type in a series of commands on one line, then the computer carries them out, answering all the prompts, etc. If you find yourself repeating certain tasks just too frequently, you can store them on disk and run them as required with the "run batch file" on the system menu.

Even the directory has been changed, meaning "less sector counts" have been done away with. The size of a file is now displayed in bytes. This seems odd at first, but is a great idea. DOS XE is also capable of date stamping files, another nice touch, fairly useful and a good way of showing off!

Overall, there's not much more I can say - DOS XE is excellent, streets ahead of DOS 2.5. If it had been more readily available a few years ago, with everyone using it now, it would have earned the Atari 8-bit a great deal of respect. Sadly, though, DOS XE will never replace DOS 2.5. Software support is virtually non-existant (although it might be better in the States). The only software I know of that directly supports it, is Diamond GOS (the two of which, I am told, makes a very powerful combination).

Admittadly, it's not SpartaDOS, but it's not 50 pound either (that's assuming you can get it now Frontier has deserted us). Myself, I quite simply refuse to pay 50 pound for a disk operating system. Anyway, DOS XE does all I need it to. It's the next best thing to Sparta. If you have an XF-551 you HAVE to get DOS XE. But whatever drive you own, it comes highly recommended.

At the very least it will give your lovable old Atari a facelift (don't you just get fed up of that boring old DOS 2.5 menu?), but investigating further will uncover a highly efficeint means of file management.

One of the best 2 pounds I have spent for ages. Eternal thanks to Dean Garraghty for making it available over here.

Thanks to Paul Allton for this article. Hope the new hand was reasonably priced, Paul!

Are you talking to me or someone else Bill? In future when you reply to someone in a newsgroup can you tell us who you are replying to please? Well if it was me I take it all back, it seems that GOE and GOS are two different programmes. I see from someone elses post that GOE was never finished or released so sorry it seems you are going to miss out!!

>BBS 716-586-5545 or my BBS 216-545-4817.
>
Joseph, do you think you could possibly cut down a little on the quoting you do? There is no need to quote the WHOLE message from the person you are replying to especially when it has the WHOLE of your previous message in it too!!

Come on net folks, lets cut the quoting down just a bit shall we, it gets awfully monotonous to keep reading the FULL SAME messages over and over again! Just a few words or a couple of lines is plenty as a reminder. TO THOSE PEOPLE WHO USE OFFLINE READERS please check that there is no more message AFTER you have finished yours, you seem to be replying to someone and saving it without realising that the rest of the replied to message is still there and it is added to the end of your reply.
Does anyone else agree with me on this or am I just being too grumpy today.....<well it is pouring with rain and freezing at the same time>!

Hey! I have good old Berzerk for my 2600. Well..sorry to say I forgot where I put my 40+ manuals, but I did look at it last time I had it (a few months back.) Yes, YOU are the intruder. The object is to blast the robots, don't touch the walls, don't touch thr robots, don't get blasted BY the robots, and don't let Evil Otto (I can't believe I remembered that. Wish I could remember my history!! :)) splat you (he's the bouncing funny-face..he can't be shot. One some levels on the 2600 he'll leave for a while when you shoot him, but he'll come back soon!). That's pretty much the game. I think it's a pretty fun game, even tho that's ALL you do! I've been thru ALL the levels on the 2600 version, (of course I played the "teddy-bear" kiddy level where they don't blast you hehe) and it just starts over again. I've never seen it on the 8-bit. Too bad they didn't get the 2600 version to talk. I wonder, can you tell if it's synthesized or digitized?? Have fun!

> US doubler) and now it makes less noise. The documentation included with
> the 'Turbo Modul' says this is achieved by increasing the step rate of
> the stepper motor in the drive.
>
Does this speed the drive's access time? And I'm wondering about the
810's VTOC... where is it located compared to on the 1050's.. I
noticed that when the head writes on the the 1050 the head moves to the
following:

```
^^^ back of drive
| <-head
=|=
=== <-write area
===
=== <- directory (VTOC??)
===
=== <-more write area (the more space used, the more to the front of
=== the drive the head moves to write on...)
```

Ok..so it's not a very good picture, but it's all I can come up with in 1
minute! Anyways, this is what my unupgraded 1050 does when I open a
file:
goes to directory

starts writing onto the disk (beginning towards the back of the drive and
ever so slowly moving towards the front)

goes back to the directory and writes something
(I forget if the head sits there or moves to the back of the drive)

Anyways, I'll take it the dir is written there to be compatible with
810's? Am I wrong? Is it just there because it's easiest to get to (on
the average) from any point the head is sitting at?

You can't kill the bouncy guy.

Chuck Bueche (best known as "Chuckles" of Origin Systems) wrote a game called "Creepy Corridors" for the Apple II that featured a digitized scream. The game was marketed by Sierra On-Line circa 1982. According to the book "Hackers" by Steven Levy, Chuck tape recorded a scream and then digitized it and included it in the game, where it ate up 20% ofthe Apple's memory....

2123. Re: Only 128 colours?

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-29 02:12:38 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <RZJiLB2w164w@cyberden.uucp>
Source record: 111121

Jeff...you said that ONLY the GTIA modes (9,10,11) can use ALL 256 colors. I believe you are incorrect (sorry!). If I recall, mode 11 can view 16 colors, with luminence of the colors set by the background (712)'s lower nybble. All colors except black can be increased and decreased in luminosity in this way. The only problem is, like all the CTIA modes, the lsb is ignored. In mode 10, the one that uses all 9 color registers (and seems to be the ONLY mode which can be emulated correctly in tall modes such as 7 (I'll get into that later)), again the lsb is ignored! ONLY mode 9 can view 16 luminances. Here's a trick to THAT mode, as well!!! If you change the luminance nybble of the background register in THIS mode, the entire screen, except the pixels with luminances greater than the selected background will be turned into the background color. AGAIN, the lsb is ignored!!! If you had a COLOR 15 pixel on the screen, and you said POKE 712,15, the brightness will be 14 (lsb being ignored here!!) and the COLOR 15 pixels will be the only ones visible! Is this strange or WHAT!? THEN AGAIN!!... I am using a 1200xl and there is a SLIGHT chance that the GTIAs might have been upgraded, but I'm just guessing. NOWHERE have I ever heard about this...! Anyways...as for some other facts for those of you not to familiar or experienced with the GTIA modes: the only mode that does not set the registers to default (I'm not sure exactly what they are...) is mode 11. It sets luminance to 4 so the pixels are shown better. Hopefully this isn't just something BASIC does, otherwise I'm wrong in al but that case. Also, with mode 10 being the only mode visible in "tall" modes (like GRAPHICS 7..inotherwords you select mode 7 then POKE 623,128 to get into the 9-register-using mode): I have a paint program called PAINT 10-7 which uses a cross between these modes (it does what I explained just now to give you 9 colors avaliable) to give you 80 x 96, which IS easier to use the 80 x 192-- for drawing. Most applications (GIF/other format pics -> Atari or digitization need VERY hi rez to keep up with the Itsy Bitsy Machines MacinTrashes and ST's (I won't even DARE say what I came up with for ST!! :) don't want TOO much flame mail! ;)). Anyways.. if you POKE 623,64 (for mode 9- you can do this from mode 8, for example, to view 16 shade pics) or ,192 (for mode 11) while you are in mode 7, you'll lose the last 6 colors!! (inotherwords, the colors would go:

```
gtia/7 normal gtia
0 0
1 1
2 2
3 3
4 4
5 5
```

6 6
7 7
8 8
9 0 (? not positive here..might start at 1 again..)
10 1
11 2
12 3
13 4
14 5
15 6

This is a curious effect. Is this just a quirk or bug in the GTIA, or is there a LEGITIMATE reason for this? (other than the chip was designed in the early 80's! (late 70's!?)) This brings up a good question-- has anyone ever tried to make a GOOD upgrade for the GTIA? or even a whole new graphics chip to use in place of the GTIA??? Bill

>How does one quiet the "bzz bzz" noise the 1050's make when their heads
>move?

The noise is the head sliding along the rails and I have had very good luck with very light plastic compatible oil. You put a VERY small amount on each rail that the head moves on. Best source for this oil seems to be Model Railroad supply places. When I say a "small amount" I am talking about puting a drop on a match stick and rubbing it against the rails. I have had NO problems with this, but a heavy application of oil COULD collect dust or migrate to the head itself, so go light!

The 1200 xl has the equivalent. Matter of fact, if you want to change over to an 800XL type system with built in BASIC, it's as simple as putting in the 800XL memory management chip & soldering in a BASIC ROM.
On chip names: You may have heard about the old Atari used to do a lot of hot tub meetings & that's supposed to be where the habit of naming projects after women with large mammary glands started. Anyway, at an Atari wharehouse sale I saw a couple of prototypes with names like Peggy etc.
Colleen=>CTIA
George=>GTIA (George????)
Sally=>CPU
Whoops! I just opened my 800 Tech Ref "Colleen Manual Audio & Serial Port"

From : PMDF Mail Server <Postmaster@aukuni.ac.nz>
To : Dawn_Scotting@kcbbs.gen.nz
Subj : Undeliverable mail

The message could not be delivered to:

Addressee: phbill@well.sf.ca.us
Reason: <phbill@well.sf.ca.us>... User unknown

(Most header lines deleted)
Date: 28 May 92 13:23:43 EDT (Thu)
From: Dawn_Scotting@kcbbs.gen.nz

>HELP! Is my mail bouncing?! Somebody please mail me! :) Thanx!

You don't need to reply to this (I have to pay for ALL email), just hope
you get it okay.....Dawn

Well there you are, it looks like you are having a bit of trouble
getting your email! I'm no expert on this but I think it maybe because a
lot of sites don't recognise addresses with the % in them, but then
again I only sent it to phbill@well.sf.ca.us and it still didn't get
there. Anyone else know why? Maybe Jeff McW?

2132. MIO vs BB

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-29 20:39:40 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9205292039.AA19847@smithkline.com>
Source record: 111127

I recently added a BB/FB to my system. The FB (Floppy Board) is a new item which apparently still has a few teething problems, as CSS has sent me 3 new ROMs in the past month. Two of these were for the BB, & one was for the FB. Apparently minor bugs involving the printer buffer & HD floppy formatting. When you plug the FB into the BB, the whole assembly really seems to suck a lot of power & gets very warm. It seems to work OK tho.

I got to playing around w/my MIO & would to report a new observation. My MIO is REV 2, S/N 1657 (mfd. ca. 1989) 256K w/firmware rev 1.1k. Just fer the heckuvit I stuck the MIO EPROM into my ROM reader. I read the ROM 5 times, & each time it gave me a different checksum! So, I could read it but could not verify the generated file. Most weird. I figure there are 3 possibilites:

1.) I got a flaky ROM
2.) The ROM was programmed at the wrong <too low> voltage, so a few bytes maybe didn't get burned in hard enough for my reader to "see" (even tho the ROM might still function OK)
3.) ICD added some kind of nasty little anti-pirate code to prevent the ROM from being reliably read.
Any one of the above could be a source of mysterious crashes or other inexplicable events. I don't even want to guess.

One the subject of upgrading a 265K MIO to a 1 meg MIO, absolutely YES, it IS possible. Possible, but not easy, & not cheap. You need ICD's 1 Meg MIO ROM, 32 256K ZIP DRAMs, & 32 supply bypass caps for the DRAMs (.01-.1uF). As far as getting the ROM- yeah, right, I'm sure ICD will just hand you one off the shelf. WHOOPSSSSS! Let me correct myself on the number of DRAMs/bypass caps you need to add: it should be 24, not 32 as I said above. (For 1 meg there are 32 DRAMs total, but in the 256K you already got 8 on the board so you add 24.)

The 256K DRAMs are NOT your ordinary garden-variety quarter-megx1 types. Naw, that would be too easy. These little devils are hard as heck to find, they are the sideway-mounting ZIP style (ZIP= Zigzag Inline Package). After much searching I found them in the Active Electronics & Easy Tech catalogs. They are cheaper from EasyTech, but the average price seems to be around $3/chip. And of course you don't order just 24, when buying RAMs like this you should always order a couple extra as a burnt offering to the Murphy god.

Two years ago Cliff Terry at ICD quoted me a price of $25 for the 1 meg ROM (of course that was back when ICD was still in the 8bit business). Assuming it's still available, figure $30 including shipping. Then there's your RAMs, figure $85 including shipping. Another $3 for the bypass caps. Figure on plunking down the better part of $130 for this little hack.

But buying the parts is easy compared to the next step. You see, ICD wave-soldered the MIO. So all the unused holes must be cleared before you can start

stuffing parts. People, these are *little* holes! And by my count, there are 264 of them! I'm a seasoned hacker, & in my judgement this requires expert soldering skill. The traces are so fine, you can break one easy w/out seeing it. And it only takes one broken trace... you kiss the thing goodbye.

I'd say this is a hack for a hacker who wants to strut his stuff. If you want 1 meg, it's easier/cheaper to get the Newell 1meg board.

Heheh.. I just took a sip of Pepsi and as I was putting my can on top of my 1200xl, SPLAT I got a bunch of pepsi in the keys! Then my system started sending something non-ASCII (I was on a BBS at the time and I noticed the key click noise and the modem sending but not receiving...) So!...I QUICKLY dismantled the system and tried to figure out the best way to clean up. I finally took off the board underneath the keys. (about 15-20 little screws needed to be removed) and finally figured...what the hell!, walked outside..got a hose...and...hahah. Works just fine, and is 99% cleaner than before! (my keys have that brown-charcoal color again!). I'm wondering if this'll totally destroy my keys eventually?... is there any way at ALL to remove the keys themselves...and, say, throw 'em in the dishwasher..!? :)

2135. Diamond

Newsgroup: comp.sys.atari.8bit
Date: 1992-05-30 03:35:01 UTC
From: t90adr9@mp.cs.niu.edu
Message-ID: <1992May30.033501.25180@mp.cs.niu.edu>
Source record: 111131

It's interesting to see that people are still talking about
Diamond GOS and GOE. Business is dead in that market for me so it was
a surprise getting two EMail messages on the subject when I checked
in yesterday. To differentiate between the two and maybe a rief history
of GOS type items for the 8-bit here goes:

Zobian Controsl had their RAT product and promised a Graphic Interface
which turned out to be a basic GOS like DOS shell. Their product never did
much.

David sullivan released a text mode program called G.O.S. which was also a
DOS shell.

We (REEVEsoft) annouced Diamond and later head that David Sullivan was working
on a new, better G.O.S. called GOE which would be marketed by Merrill
Ward. Later then got in touch with us and basically all I can say
there is thigs didn't workout. Long sad story.

Anyways, G.O.E. was a very pretty [rogram and Mr. Sullivan filled the
airwaves with claims. G.O.E. was never produced so now I kind of chuckel
when I read about how inferior Diamond was. It's like saying a blueprint
is better than something that works.

Re: Diamond only uses 1/3 of the cart and Diamond doesn't use 320 by 192
mode and how it's full of bugs (although of course no specifics, huh?),
that's misinformation. A lot of misinformation was spread at the
time. It leaves me with a pretty bad taste in my mouth as far as the
Atari market, but overall I love the 8-bit and learning how to
program it was very educational.
A. Reeve
P.S. Anyways, we're sold out of Diamond carts and getting more would be
rough. We've been in contact with some people about taking over the
project with no success. We still offer support as best as we can, but
aside from that we're no longer involved in any significant 8-bit
development. That's the current state of things.

2136. For sale : 800XL Indus GT drive, modem, etc

Newsgroup: comp.sys.atari.8bit

I have a complete 800XL system for sale.

I have the 800XL unit with an Indus GT drive, several joysticks, a 300 baud modem, 15 - 20 disks of software, a few cartridges, and several magazines.

It all works fine, and it has everything you need (all cables and adapters).

You pay shipping (which will probably be a lot, there's at least 30 pounds of stuff here).

Make a reasonable offer if you are interested.

Interesting, but there's a user in this area that upgraded a 256k MIO to 1Meg, using a much simpler process, and believe it or not, ICD actually DID GIVE him the 1 meg rom for his upgrade (a shocker indeed!). Anyway he also placed an article about his work on Compuserve. Don't know if it's still there, but it was a well written article and he used 1 meg chips. I still have about 2 weeks left until the local user group get's together, so I'll see if I can get a copy of the article from him. This is also the same user who has a VERY long cable between his MIO and the CPU.

Almost the same thing happened to me back in '85 with my 800XL, the only two differences were that I spilled Coke into my keyboard, and I turned off the power before any fluid got into the keyboard. I took the keyboard assembly apart and washed all of the keys and the rest of the entire assemblly (the entire computer) with alcohol to insure there was no sugar anywhere.

Well, it is now 1992, and I'm using the XL as I type you this message, and it's got a 1 meg upgrade inside. I don't think you'll have any trouble with it if it's still working after spilling liquid inside of it.

Ok...here's the deal. My dad called Wells Fargo Bank the other day asking about sending money internationally. They said "oh! It's no problem, just go to one of the bigger branches [in the next town] and ask them for a money draft". (This is like an international check I guess). Of COURSE they didn't mention that it'll cost $25!!!! Quick, which is what I'm getting the marks for, COSTS only about $25US!!! NO THANX! So we ask about ordering marks to send as cash to Germany. Ok..2 weeks. Guess WHAT!? $100US minimum!!!! Well now! NO THANK YOU AGAIN! So, here's what I'm going to do. I'm going to send about $27 to $30 US cash to Power per Post for it and cross my fingers! My dad, who was a GI in Germany for a while, said that US$'s are about the only money that can be exchanged in almost any other country without too much hassle. (BTW: the current going rate for DM's -> $ is 1.85 -> 1, inotherwords the $27-30 should be enough US$ to be equivelant to 49DM's that Quick + p&p costs). Anyways. I hope I'm the first to have to go through this hassle, so I could inform you. (I'd murder anyone who DIDN'T because they had a nice chance to TELL us about it FIRST! :)) Anyways. That's one of my 2 complaints of the day!! Bill

HELP! I think it was me who did this... I messed up my drive release spring of my 1050. The spring's ends are sort of like hooks and 1 connects to the metal-thingy!?-that shoots the disk out when the door is opened, and the other to a stationary peice of plastic on the drive. Anyways, I guess I screwed up one of the hooks, so after a half-hour's work, I thought I had it fixed and put it back together (I was ATTEMPTING to clean dust out of the thing). Anyways.. after I a while the spring popped out AGAIN... so, I finally decided, rather than try to fix the hook parts anymore, to just relieve the spring of some pressure, so I stretched it. Ok. It works fine. Sure, the disk doesn't fly out like it used to, but at least I don't have any more problems. Or so I thought! As of yesterday, I found it must've come out AGAIN!! When I turn the drives door (which is supposed to flip to the horizontal position), it doesn't flip all the way! I can force it (NOT a good idea!), and when I tried to stick a disk in, it couldn't get more than an inch in!!! HELP! Where can I get new disk-release springs for 1050s!? Or is there another way for me to fix this!? (or should I trust myself to opening it up again!? :)) Thanx in advance. Bill

Its been a good 5 or so years since I last saw my Atari 800, and now that I've got it connected to the tv, I'd like to read some of the disks that I collected over the years. Shortly before I stopped using it, I bought a Rana 1000 disc drive and copied a lot of files over to double density format. Problem is now I can't remember how to read them. I've also got an Atari 810, and when I use that as the boot drive, the rana will stay in high density mode, but I've no clue as to how to get dos to read the disks. If I boot from the rana, it comes up in low density mode, and won't recognize the high densiry disks. I would look at the manuals, but alas, I think they are still in Denver, while I am in Dallas. Any help would be appreciated.

Thanks, Roger

P.S. Anyone got a star raiders cart for sale cheap?

2153. MIO vs BB

Newsgroup: comp.sys.atari.8bit
Date: 1992-06-01 23:47:07 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9206012347.AA06530@smithkline.com>
Source record: 111152

Well Rick, yeah, I *was* using a Proburner to read the MIO ROM. From CSS.
Just got it a few months ago. I've noticed a couple other weird things it does,
but so far it's only the MIO ROM that gives wandering checksums. Gee, don't
tell me my burner is dying, man I don't wanna hear that.

Amos, I'm now absolutely convinced you made up all this stuff about this guy
w/the long MIO cable who upgraded his MIO w/1meg RAMs. You're trying to mess
w/my mind, right, make me crazy, ring my chimes, etc. Like, who *IS* this
wonder-person who does all these marvelous things? Gimme his name/address,
I want this guy for a columnist!! Where did he get 1-meg ZIP-DRAMs??? I
searched Heaven & Earth (didn't try Hell, tho). So you made this up, didn't
you? I know you did, you can admit it now, you wanna drive me crazy I know.

mutter, mutter, mumble, mumble.....

I'm sending this via csa8 again, that'll probably make me crazy too, when it
bounces.....

mutter..... mumble.....

2154. comp.sys.atari.8bit Frequently-Asked Questions

Newsgroup: comp.sys.atari.8bit
Date: 1992-06-02 00:46:00 UTC
From: CURRENTM@CARLETON.EDU
Message-ID: <01GKPKZUHRMO9D4HR1@carleton.edu>
Source record: 111151

New for this release: DJG's News-Disk.

Frequently-Asked Questions

comp.sys.atari.8bit

Revised 26-May-92

additions/corrections/comments to Michael Current (currentm@carleton.edu)

What is comp.sys.atari.8bit?
comp.sys.atari.8bit is the Usenet newsgroup dedicated to the free exchange of information pertaining to the 8-bit Atari computers: the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, and the XE Game System. Users of Atari TT, STe, or ST computers refer to comp.sys.atari.st. Users of Atari Portfolio computers refer to comp.sys.palmtops. Users of Atari Lynx, 7800, 2600, or 5200 game systems see rec.games.video.

What is the Info-Atari8 Digest?
The Info-Atari8 Digest consists of postings to comp.sys.atari.8bit, collected and e-mailed to subscribers on the Internet who do not have access to Usenet. To subscribe or unsubscribe to the Info-Atari8 Digest, send e-mail to Info-Atari8-Request@naucse.cse.nau.edu.
Cross-posting from the Info-Atari8 Digest to comp.sys.atari.8bit is not implemented at this time. Thus, one should NOT post to Info-Atari8@naucse.cse.nau.edu. Rather, one should send his/her posting to comp-sys-atari-8bit@ucbvax.berkeley.edu to ensure that the message will appear on comp.sys.atari.8bit.

What is the atari.archive?
atari.archive.umich.edu is the Internet site which contains many files for the 8-bit Atari computers. The 8-bit Atari Archive Moderator is John Dunning, jrd@stony-brook.scrc.symbolics.com.

How do I download files from the archive?
Two methods:
1. If you have FTP access you can FTP to atari.archive.umich.edu (141.211.164.8), login as "anonymous" and type in your e-mail address as your password. Now type "cd atari/8bit" to reach the 8-bit directories. If this is your first visit to the archive, be sure to download the file -read-.-me-. Other files of interest are 8-bit.cat, containing 1-line descriptions of all the files available, and 8-bit.text, which contains paragaph-long descriptions. Be sure to have file-type set to BINARY when downloading binary files (.arc, .com, etc.)
2. Send mail to BART, the atari.archive file-server. BART's address is atari@atari.archive.umich.edu. If you are a first-time BART user, send it a message that says:

help
send 8bit/-read-.-me-
send 8bit/Index

BART automatically UUEncodes binary files before sending them to you.
Other files of interest are 8-bit.cat, containing 1-line descriptions of all
the files available, and 8-bit.text, which contains paragaph-long descriptions.

How do I upload files to the archive?
Three methods:
1. FTP to atari.archive.umich.edu (141.211.164.8), login as "anonymous",
type in your e-mail address as your password, and then type "cd
atari/8bit/new". You may upload files to this directory. Be sure to set
file-type to BINARY if uploading a binary file (.arc, .com, etc.) Also,
please upload a short .text file describing your upload so John Dunning can
tell what permanent directory to move it to.
2. Send your upload by e-mail to jrd@stony-brook.scrc.symbolics.com. If
you're sending a binary file you must UUEncode the file first. Be sure to
include a short descrption of the file at the top of the message so he knows
what directory to place it in at the archive.
3. If you can neither FTP to the archive nor e-mail to John Dunning, then
you are welcome to post your file, UUEncoded if binary, directly to
comp.sys.atari.8bit. You'll then be relying on someone else to take your
posting and upload it to the archive for you.

What is Z*Magazine?
Z*Magazine ("Z*Mag") is the International Atari 8-Bit Magazine,
published bi-weekly. It covers the 8-bit Atari computers exclusively.
To have Z*Mag delivered "right to your own mail box," send a message
to Ryan 'Gozar' Collins at rlcollins@miavx1.acs.muohio.edu, asking him to add
your address to his Z*Magazine Distribution List. Back issues of Z*Mag are
available at the atari.archive in the /atari/8bit/zmag directory, in filenames
such as zmag204.arc.
To reach the publishers of Z*Magazine, contact Ron Kovacs at
75300.1642@compuserve.com, or Jon Clarke at jonc@status.gen.nz.

What are the News-Disks?
The Atari 8-bit News-Disk ("News-Disk") is an on-disk Atari 8-bit only
magazine from the UK. It is sent on-disk to subscribers in the UK, but is also
made availble to people with email or FTP access. Each issue is supplied in
ARC format. They are not in straight text format like Z*Mag. Each issue
contains articles on various aspects of the Atari, along with programs in
Basic, Turbo-Basic, and M/C. Some issues also contain .PIC files (viewers
always included), speech files, and some others. Every issue contains a copy
of XR_40 for viewing text files on the screen, and a copy of a simple program
to print articles. Alternatively, you can read/print from any word processor.
Each issue should be unARCed onto a single density disk with a copy of
DOS 2.5 DOS.SYS on.
All issues are at the atari.archive. They are accessed by
'/atari/8bit/djg/issueX.arc' where X is the number of the issue desired.
To submit articles, mail djg0@aber.ac.uk.

What is the Cleveland Free-Net Atari SIG?
The Cleveland Free-Net Atari SIG is like a huge public bulletin board system. Anyone can access the Free-Net via modem at (216) 368-3888. Those persons with full Internet access can TELNET (this does not mean FTP) to freenet-in-{a,b,c}.cwru.edu (129.22.8.{82,75,76}). Applications for accounts are handled online. Once logged-in, type "go atari" to reach the Atari SIG. Those who add their names to the Atari SIG members-list are automatically members of the official Atari users' group CAIN - Central Atari Information Network.
CAIN carries Z*Magazine and the Info-Atari8 Digest, as well as many product reviews and all sorts of other information related to Atari products, all online. Its mission for 8-bit users is as a depository for any and all information in ASCII format related to the 8-bit Atari computers.

Are there any product developers or vendors still supporting the 8-bit Atari?
Ben Poehland has created quite a long list of firms devoted to the 8-bit Atari market. This file is called vendlist.arc in the /atari/8bit directory of the atari.archive.
Ray Wilmott maintains a similar list. Contact him at
wilmott@remus.rutgers.edu

What is an .arc file?
A file with the extender .arc has been archived, in a standard manner that

is common in the IBM-PC/MS-DOS world. This is done to make the file shorter, so it takes less time to transfer between computers. The atari.archive contains an un-arc'er called supunarc.com for the 8-bit Atari. The companion program is called superarc.arc (use supunarc.com to un-arc it). Each is compatible with the MS-DOS equivalent.

What's this UUEncoding stuff all about?
UUEncode/UUdecode is a UNIX utility that will convert a binary file into 100% printable ASCII characters, so that the file may be posted or e-mailed anywhere a text message can go. The 8-bit Atari is perfectly capable of UUEncoding/UUdecoding as well. The file uudecode.bas (the documention file is uudecode.doc) is at the atari.archive. It's in Atari BASIC text format (ENTER it into Atari BASIC). The file yau.arc contains yau.com, a machine-language UUdecoder, and yaue.com, a UUEncoder for the 8-bit Atari. Each is compatible with the UNIX equivalent. UUEncoded files are given the extension .uue.

Can I read/write 8-bit Atari disks on an IBM-PC?
Yes! There are three files at atari.archive that claim to do this. They are: atario21.arc, pcxfer.arc, and util.arc. Each of these programs runs on an MS-DOS type of computer. For disks written on your PC to be read on your 8-bit Atari, you must have an Atari disk drive capable of accessing at least 180K, SS/DD disks. That is, an XF551, Indus GT or equivalents, but not an unmodified 1050 or 810. There is no way to write 128K or 90K Atari-format disks with an IBM-PC. You will also need either SpartaDOS or MYDOS on the Atari.

What's the best DOS for the Atari?
This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system. MYDOS is an extension of Atari DOS 2.0S/2.5 that provides subdirectory and hard-drive support. SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2D is disk-based; SpartaDOS X is cartridge-based and includes many additional features. While it's hard to argue that SpartaDOS X is not the most advanced DOS available, it is a commercial product that is no longer manufactured. MYDOS, on the other hand, is a shareware product that continues to be improved upon. It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. MYDOS is available at the atari.archive.

What are the best telecommunications programs available for the 8-bit Atari?
It all depends on what type of computer you intend to connect to. For connecting to Bulletin Board Systems, BobTerm is the unchallenged favorite. For connecting to larger computers, you will need a VT100 emulator. Several are available for the 8-bit Atari, each with its own advantages. Kermit-65 is a VT100 emulator, provides Kermit file transfer and an 80-column screen display, but does not support the XEP80. VT850 is a VT100 emulator that supports the XEP80 but provides no file-transfer. OmniCom is a VT100 emulator providing both kermit and xmodem file transfers, plus an 80-column display, but does not support the XEP80. Each of these programs is known to work with the

SX212 Modem connected to the SIO port, and to work under SpartaDOS and MYDOS;
each program is available at the atari.archive.

2155. Re: Any information on the Atari 2600 Connection ?

2156. Re: GOS 3.0

Newsgroup: comp.sys.atari.8bit
Date: 1992-06-02 04:12:04 UTC
From: Jeff McWilliams <JJMCWILL@MTUS5.BITNET>
Message-ID: <92153.231204JJMCWILL@MTUS5.BITNET>
Source record: 111006

In article <uNaiLB10w164w@cyberden.uucp>, moon!cyberden!phbill@well.sf.ca.us
says:
>And THIS from one of the campaign heads!? Is this David Sullivan REALLY
>that against finishing what he could probably make big bux on?! I mean..
>ChromaCAD sold 1000 copies!! I mean, sure, I wouldn't mind having it,
>but I'm not exactly INTO CAD.. THIS thing seems to be something great
>and useful no matter what you do with your 8-bit!! C'mon! I think we'd
>better tell this guy to "wake up and smell the profit"!!!...how many
>copies of Diamond got out, hmm?? And people are being DIScouraged to buy
>it!!!
> No offense Jeff... I'm sure on any other day I wouldn't mind
>those "shut up Bill's" (I take everything as bad...it's just me), but
>today I'm a bit upset about my social life which is going down in FLAMES!
Well, to start off with, I don't know Dave Sullivan personally, or
even remotely, so I can't even begin to guess what his reasons
were for dropping the GOE project. Previous experiece with
vaporware like Turbo C-8 and GOE have trained me to more strongly
support products that at least EXIST and to not be so pie-in-the-skyish.

Regarding the profit thing, GOE was gonna be on a piggy back cartridge
like Diamond is. Those carts cost bucks, which lowers the profit
margins, and means an initial investment needs to be made to order
a supply of carts to begin with, plus burn the ROMS, etc. With
a program like ChromaCAD, all you need to purchase media wise are
disks.. which run about $.40 a piece these days. Upgrades are CHEAP.
ROM upgrades to cartridges typically cost about $3.00 to $5.00 each.
Additionally, Alan Reeve mentioned ICD no longer sells the cart
boards for piggy back cartridges. ICD I think were the only
ones who even made the piggy back cartridges. I haven't seen
the Express! cart. but I suspect he used ICD cartridge boards as well,
since Express was a piggy-back cartridge.

So you see Bill, it is much harder to develop a cartridge based
product than it is to produce a similar product on disk.
Personally, with the popularity of memory upgrades being what they
are, I would much rather see a new program take advantage of
the extra memory, instead of stuffing all the code into a banked
ROM cart. Alan mentioned looking to make a deal to sell the rights
for Diamond. Why not purchase the rights, modify the program so that
it can be sold on disk, and get rid of all those "nasty bugs".

Yeah, I was getting pushy, Bill. I suppose I was getting frustrated
because I really felt that going after the GOE was a wild goose chase,
and despite all my efforts to point you toward more realistic
goals, you continued to be your regular, stubborn, loveable self.

I don't claim to know everything about the 8 bit. When I don't know what I am talking about I usually keep my lid shut, but when I do speak out it is usually because I have a pretty good grasp of what is really going on. I rarely take action based on assumptions and rumors. It's just... bad karma.

So no offense, I'll try not to gnaw anyone's arm off next time I am in a bad mood.

Jeff McWilliams

From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <59959@cup.portal.com>
Source record: 111154

IF(big IF) you could get the source code and recompile it to run from the $8000 to $BFFF area it shouldn't/wouldn't be a problem. Of course you'd lose 8k of ram to the cart vs hiding it under the OS. TB is an absolutely lovely language, but wait'll you try Action! In all test I've run, I've never been able to code more then 2X as fast as Action! when using M/L.
BTW: I even hacked a SpeedScript cart once (or twice) for my kids to use. They could never take care of disk.

I wouldn't mess with your mind ;) . But seriously, the guy's name is Rich Mier, and he's a Sr. Tech at Unisys. He also did my 1 meg upgrade fot the 800XL and during that process, came up with a better way of doing it! I would kinda like to get the XE upgraded to 1 Meg, but I don't want to loose the internal BASIC, so I guess I'll leave it at 320K. He did that one also.

2161. Re: its been a while....

Newsgroup: comp.sys.atari.8bit
Date: 1992-06-02 17:13:07 UTC
From: Jeff McWilliams <JJMCWILL@MTUS5.BITNET>
Message-ID: <92154.121307JJMCWILL@MTUS5.BITNET>
Source record: 111014

Roger,

Your density problems could be due to several problems. First which DOS
are you using? Atari DOS 2.0s? DOS XL? If you are using Atari DOS,
there is no way to read double density disks with that DOS system.
I believe someone may have modified it along the way, but I've no knowledge
of where to get a double density version of Atari DOS.

DOS XL, if you are booting from your 810 drive, has a program called
CONFIG.COM which can be used to tell both the DOS XL and the Indus drive
to read double density. With your DOS XL disk in drive one (the 810)
and the Indus GT as drive two, at the command line prompt of DOS XL, type

CONFIG 2D <RETURN>

where <RETURN> means press the return key. This will set up the drive
to read those double density disks.

I used to have an Indus GT myself, and used it for quite a while with
DOS XL to get the high speed capabilities of Synchromesh II sector interleave.

Then when I sold the Indus and bought an XF551, I switched to SpartaDOS.
If you are familiar with DOS XL, SpartaDOS will be quite easy to use, as
it is also a command line based DOS with .COM files allowing you to do
a million different things.

Other DOS's that support double density and that should work with your
system include SmartDOS, Mydos, OS/A+, TOPDOS, MachDOS, and SpartaDOS X.
I am familiar with SmartDOS, Mydos, and SpartaDOS and SpartaDOS X, so if you
own any of these and are having difficulties feel free to send me any questions
you might have. OS/A+ was sort of the father of DOS XL and so they work
very much the same.

Hope this helps.

I have the following complete system forsale. THE SYSTEM IS CURRENTLY
compatible with ST software, PC software, and is ready for MAC emulation,
and ATARI transformer. READS AND WRITES 720K PC/AT disks, and ST formats
also.

*ATARI 520STfm with 1 meg RAM, 720K internal Drive
With internal clock and calender, keyboard
anti-static pad, 9 pin extender for easy access, and
TopCase Cooling FAN (LOW NOISE) for the POWER SUPPLY
SPECS:
MC68000-8Mhz 32 BIT/16 BIT arch.
MIDI IN/OUT
VIDEO card built in for low, medium, and high rez.
Emulates MAC with GCR 30% faster than the MAC
(GCR not included)

*BEST MOUSE (2-button oval shape) w/pad

*External 360K drive

*RGB color monitor ATARI 1124 w/ swival monitor stand

*External HardDrive Case with Power Supply (Ready for HD)

*about 400 3 1/2" 720K floppies with case holders.
Many titles that still have original boxes.

Such Titles as:

PC-Ditto software.
SPACE ACE
WAR IN THE MIDDLE EARTH
FIRST WORD
SHADOWGATE
BAAL
WAR CONSTRUCTION SET
OGRE
OBLITERATOR
and more...

*BOOKS such as GEM programmers reference from ABACUS
MANUALS, MAGAZINES, AND ORIGINAL BOXES are included.

>
It could be done, but why not just get a Basic XL or Basic XE cartridge?
Hiding under the OS is no big problem, you would just put a routine in the
cartridge to copy the code into the OS area, then switch off the cartridge
so TBasic could use the area under the cart.

From: etxansk@garbo.ericsson.se
Message-ID: <etxansk.707567943@garbod20>
Source record: 111019

Marek Tomczyk put in a comment on Berzerk, about the sampled speech. He wondered if perhaps E.T. was the first game (at least on the Atari) with sampled/synthesized speech.

Anyway, how do I make it talk? I've heard it's supposed to talk when a level (or the whole game?) is completed, but I don't know what to do.

(Why do people loose the instructions to all the old game cartridges?)

Anders Skelander

2168. XFormer

Newsgroup: comp.sys.atari.8bit

From: i921652@redgum.ucnv.edu.au
Message-ID: <1630@sheoak.bcae.oz.au>
Source record: 111023

Does anyone reading this have any experience with XFormer for the Atari
ST (Sorry, I loved the 8-bit, but I can't afford one now)? I'd just
like to know -
*What are the programs that I *MUST* have?
*Can I still get an XFormer lead to attach an 8-bit drive?
*Where?
*Why is the colour emulation on V2.55 not as good as V2.1?
*Why can't I find a game on the ST that I enjoy as much as the
8-bit games I used to play? (The exceptions are robotz and
llamatron:- 8-bit design philosophy
*How compatible is V2.55, and what percentage of 8-bit speed
does it run at? (Just downloaded it last night)

Hope someone can help! Replies to i921652@redgum.ucnv.edu.au

Long live 8-bits!
(PS I wrote my first ever program on an 8-bit.
Look what it started!)

Via the generic IRQ vector at [$FFFE]. The IRQ handler must do something like a PHP, PLA, AND #$10, BNE BRK_HANDLER. And save all the used registers, of course.

Just out of curiosity....

How many of you remember when the 800 was $1000 with 16k?????

That was 1980, and when I got mine! You got a basic cartridge, 410 program recorder, a skimpy manual, and thats it. Since then I have gotten 800xls, 130xes, and even a 600xl. Not a single one of them gave me less trouble the the 800. Of the bunch it is the only one that still has all it's original equipment, and the rest since needed repair. I guess it goes to prove you DO get what yo pay for!

Long Live the 800!

Bob

Dingbat Alchemist here, Jeff McWilliams is right, I was using the Super E-Burner from CSS when I was fiddling w/the MIO ROM, not the Proburner. Dunno what I was thinking, too much Atari Classics stuff clogging my brain cells. I gather the Proburner is one of those things encased in solid potted plastic. MEK, heh? Hmmm... you a chemist too Rick?

For Jeff Potter, thanks for the info on 1meg ZIP RAMs. 'Course, w/no source, dunno how useful that is. I also wonder how you would do the upgrade w/such chips. You just stick them in place of the 256K ZIPs already there? Or add them to the 2nd bank of blank spaces?

Which brings me to Amos Jackson. Hey, any chance you can introduce your Mystery Man to the Net? We could sure use a guy like that around here! Adds 1 meg to his MIO, puts long cables between MIO & XL, it isn't fair to keep someone like that in your pocket, you know <mutter...mutter...grumble>.

Well at least Berkely didn't bouce my posts back to me, that's something...

From: djg0@aber.ac.uk
Message-ID: <1992Jun4.152945.8754@aber.ac.uk>
Source record: 111038

I've posted the Digi-Studio info again because I've changed the payment method for foreign orders. I hope to have a US distributor very soon.

Digi-Studio Information

Digi-Studio is a new piece of software for the Atari XL/XE series.

It allows you to play music using real sounds which have been digitized.

Digi-Studio comes with a keyboard player and tune player. The keyboard player lets you use your computer keyboard like a piano keyboard to play tunes, but using real sounds, rather than computer-generated noises as is usually the case with this type of program. You can have 3 sounds in memory and can quickly change between them while playing tunes.The keyboard player has responsive keys so that the sound will only play for as long as you hold the key down.Just like a synthesizer!! The Digi-Studio disk contains many sounds for use with the keyboard player, ranging from church bells, to pig grunts, to a baby crying, to screams, and lots of synthesizer sounds. In fact around 25 sounds in all. Why buy a synthesizer when your Atari can do the same?!

The tune player allows you to play pre-programmed tunes using any of the available sounds on the disk. Five tunes have been included on the disk for you to play.

Digi-Studio comes on a DS/SD disk, and includes a printed manual. It is aimed at everyone, whether musically inclined or not! You may just want to use it for fun, or compose a tune with it! The comprehensive user manual makes it a joy to use!

Digi-Studio will only work on XL/XE computers with 64K RAM. No extra hardware is required. The sound samples just play through your TV speaker!

The full Digi-Studio package costs just 5pounds in the UK, and 7pounds for foreign orders, including printed manual, and shipping. All payments must be made in UK funds (pounds sterling) and in cash if you are ordering from a foreign country. Please used the international registered post if you are sending money from abroad. US residents may pay in US$. $17 will pay for package 1 only. Order your copy today!

Package 1.5 for Digi-Studio is now also available offering more features for Digi-Studio and loads more samples and tunes. This extra pack is available with package 1 only. Check the next section for details of this new package.

Digi-Studio Package 1.5

Digi-Studio Package 1.5 is a new set of programs which form part of the Digi-Studio suite of programs and utilities. It is NOT an upgrade to

package 1. It is intended to be used in conjunction with package 1.

Package 1.5 contains two new programs for Digi-Studio: The Sample Editor and the Tune Compiler. Also included are 26 new samples and 18 new tunes for use with Digi-Studio.

The Sample Editor allows you to edit existing Digi-Studio samples, and also allows you to create your own by using a joystick. The Sample Editor has facilities for reversing samples (playing them backwards), copying pages of sample to other pages of sample, and also contains facilities to edit samples very accurately using a joystick. This edit facility also allows you to create your own samples. By using all the supplied facilities, you can create some very weird sounds! You can then save your samples to disk and use them in the Keyboard and Tune Players in package 1.

The Tune Compiler creates stand-alone Basic program modules for including Digi-Studio tunes in your own Basic programs. The resulting modules are output in LIST format for merging into your own Atari Basic or Turbo-Basic programs. The modules are self-contained and do not require any Digi-Studio program to play. Just imagine your game starting with a chorus of God Save the Queen in pig grunts, church bells, electric guitar, ..., or your own sounds created using the Sample Editor!

Also included on the disk are 26 new samples, including pan pipes, various guitars, dog woof, organs, synth sounds, and lots of effects! Also, 18 new tunes are supplied for playing with the Tune Player, or for compiling using the Tune Compiler. These include: Yesterday, Hey Jude, View to a Kill, God Save the Queen, Happy Birthday, This Old Man, and many classics.

The manual is in A5 booklet format, and has been typeset using LaTeX, and printed using an Agfa Laser printer. The clear instructions make the software a joy to use!

Package 1.5 is not much use on its own, so will be sold along with package 1. The two packages together will cost 8pounds (UK) including P&P. Copies to other countries will cost 10pounds (UK sterling in cash and sent by international registered post). US residents may pay in US$. $25 will pay for packages 1 and 1.5 together. Just fill in the order form below and send it with a cheque/PO payable to DEAN GARRAGHTY, or send cash as described above.

Package 1 on its own is 5pounds UK, and 7pounds other countries. See the first section of this posting for full details of package 1.

2187. Article: Differences between 800 and 1200-XL..

Newsgroup: comp.sys.atari.8bit
Date: 1992-06-04 15:41:54 UTC
From: bruck@BRACHOT.JCT.AC.IL
Message-ID: <9206041541.AA00413@brachot.jct.ac.il>
Source record: 111031

Sorry if anyone gets mad about this...

---- Undocumented differences between the 800 and the 1200 XL ----

This article will discuss several undocumented (for me, at least)
differences between the old Atari 800 and the Atari 1200-XL. I am able to
do this, since I own both, and have experimented alot.

Artifacted colors

In Graphics 8, setting even, odd, or both bits of one pixel will generate
different colors. These colors are different on the two computers. On the 800
the colors are white, green and blue, while on the 1200xl the white is
slightly different, and the colors are red, and a darker shade of blue.

Text

When looking at an 800-generated text screen, and then at a 1200xl, I noticed
a very different text display. The 800's were slightly pinkish and very
sharp and thin, while the 1200xl's were more yellow-greenish, and alot
more fat-looking and less sharp.
Most graphics screens, including mode 15 (7-plus), look sharper on the 800.

Graphics

The regular graphics colors look different, and look a bit more flourescent-
-ish on the 1200xl. This includes the blue of the GR.0, being very strainy
on the eyes on the 1200xl, compared to the 800.

Signal

The RF signal on the 800 is much stronger than the 1200xl, meaning that the
1200's video output is much more vulnerable to interference than the 800.
Even worse, sometimes this interference seems to come from the 1200 itself!

The monitor signal (I only have a greenscreen) of the 800 is ALOT more
contrasty and brighter, and much better for 80-column work, for stuff like
terminal emulators. This is why my monitor is usually hooked up to my 800.

ROM bugs of 800

Several bugs in the OS have been fixed on the 1200 XL:

Editor - Try this: press Ctrl-insert, and then Ctrl-right arrow. Repeat
this quickly a coupla times. On the 800, the cursor will sometimes
unexpectedly output a CR. This has been fixed on the 1200xl and works fine.

Clear Screen - When clearing a screen on the 800, the clearer will only stop
on a 1K boundary. This is OK, but sometimes, you put data
(maybe a charset) right after the screen data, and when you clear the screen,
the clear works - but some data may be lost. For example, GR.0 clears a full
1024 bytes, instead of 960. This means 64 bytes down the drain!
This, too, has apparently been fixed on the 1200xl.

Scrolling - The E: scroller, (PRINT) has been improved, and now scrolls the
screen down much more quickly than with the 800.

Note

All of these comments are random ramblings, said while using the 800
and the 1200-XL (both NTSC) on the same TV set (also NTSC).
Obviously, they were used alternately.

Anyone? Comments? Questions? Furious denials? Flowers? Blessings? Sandwiches?
All to...

From: hill@spot.Colorado.EDU
Message-ID: <1992Jun4.194600.26208@ucsu.Colorado.EDU>
Source record: 111034

No offense to Dean, but I absolutely *HATE* software that is written to run only on 64K XL-type computers!! I have an 800 with 512K RAMdisk. I don't lack any hardware required (from the description) for Digi-Studio. I refuse to support anything that excludes my more-than-capable machine. I like my 800 and prefer it to the XL's. I'm not about to scrap it for one.
(One thing for which I always respected Broderbund was that they made Print Shop Companion, which would only run in 64K, so it would accept the Axlon-type RAM upgrades.)

Billions of thanks to people like Bob Puff who still write stuff for *ALL* the ATARI 8-bits (400's possibly notwithstanding).

Again, this is not at all a personal diatribe against Dean, rather a venting of my frustration with the trend.

(Doesn't matter, I guess... soon as it comes out I'm gonna get the '040 Falcon anyway. Need my UNIX box at home! ;^))

2191. Atari User Group Meeting - Wed June 10/92

Newsgroup: comp.sys.atari.8bit
Date: 1992-06-04 20:23:20 UTC
From: daroloso@math.waterloo.edu
Message-ID: <BpC8Mx.2o6@math.waterloo.edu>
Source record: 111037
Cross-posted to: ont.micro,kw.micro,uw.sys.atari,comp.sys.atari.st,comp.sys.atari.8bit

In June, the Kitchener-Waterloo Eight Sixteen Thirty-two (KWEST)
Atari user group will have a general meeting with the spotlight on
the ST Library.

Our 16-bit library currently has over 400 disks of public domain
and shareware software.
In addition, there will be our updated catalog disk and our
disk-of-the-month.
Our 8-bit library is also available at this meeting.

As well as our own newsletter "The Hard Copy", we will also give
attendees the May (& perhaps June) issue of AtariUser.

The group welcomes new members and visitors with
8-bits, 16-bits, or those just curious.

Meetings held at the University of Waterloo in the
Math & Computer Building.

Room opens at 7:00 pm. Meeting starts at 7:30 pm.

Wednesday, June 10, 1992
DCS Course Room, Room 2009 (2nd floor)

Call 579-3695 for more information.

Hope to see you there,
Dani Roloson

Well I've done an interpreter but not a compiler. I do understand enough about the way they construct a progam to know they will never be able to match M/L for anything but involved operations: Stuff like block moves of greater then a couple K's. Almost all compilers are written to be as generic as possible so 1st they have to have a way to pass parameters to the routine, 2nd they have to use the generic routine which could be faster if it was hard coded. For example, to move a character set the compiler has to pass the source, destination, & size to the move routine. They can't cheat like if you know the last routine you used left a '0 in the A register so you don't need to initialize the A register via LDA #0. I already know the character set is at $E000 & I'll know where I'm going to stick it with out having to pass any parameters. There's other examples, but if you like Quick I'm up for a challenge. Any routine you do, I will do Quick(er <sic>) in M/L if you'd like to see. It's not to rag the Quick authors, just illustrate that it's to make a compiler that will out perform hard coding. I imagine even the Quick authors would admit that. Woops! left out "imposible" after "it's" above.

General BS: Bob Wooley is REALLY the expert on 1200 XL's. Everything I know about them I learned from him & he even went so far as to modify the output on my 1200 to improve the color. He said something like, "Those guys at the old Atari must'a been payed by the number of transistors they used in a circuit!" (Whoops! paid) Anyway, he's got a number of files floating around that show how to modify the video to be almost as good as an XE & a number of mods for adding an 800XL OS & built in Basic if you want it. If you look at a 1200 motherboard, you'll find it's set up to use 2764 EPROMs or ROMs. You have to desolder the existing 24 pin sockets & replace them with 28 pin devices, but it isn't hard if you have one of those $5 Radio Sh## bulb things for desoldering. I think he explained how to add a 27128 vs 2-2764, but I think I did it a little different. It's been a while, but I think I burned two 27128's with the lower halves containing an 800 XL OS & the top containing Omnimon so I could switch between the two OS. The only other thing you need is an 800 XL or any XE MMU chip. They seem to run $5-$12. It's a nice mod if you make it. The 1200's keyboard is better then even an ST in my mind.

I AGREE, Bob Woolley sure has the market cornered when it comes to hacks for the 1200XL. I did the internal BASIC and 800XL OS mod as well as the video modification. The video modification seemed to wiggle the screen display when I first did it, but now it's stabilized. Musta had to burn up a cap or two during the break-in period. Heh heh.
Haven't done a PBI modification to a 1200XL, but that 1200XL runs both the 800XL OS and the OmnimonXL OS just fine. The fastchip math routines sure do come in handy.....

Regarding what the original author wrote about the 800 having slightly

different colors on the screen than the 1200XL, are you running the old CTIA chip in the 800?

Source record: 111044

I'm afraid Digi-Studio has to be for 64K computers because it is written in Turbo-Basic. Why not use Frost? Well, less RAM would be available for the program itself, and the associated data areas to store tune data and samples. A lot of time was spent cramming everything necessary into RAM without the areas trying to corrupt each other. With anything less than 64K, Digi-Studio wouldn't have been possible at all.

Dean Garraghty.

Just to let people know that I'll be going home for my 16weeks summer holiday next Wednesday, so the last time I will be logging on to read mail, etc. will be Tuesday 9th. While I'm at home I have no access to the net or mail. I can't afford a modem or the phone calls! Before you all tell me to get a cheap modem, I should mention that there's no such thing as a cheap modem in the UK! Any modem or other device used on the BT network must be approved by them. Very few modems have been approved, and those that have are very expensive. A crummy 300/300 would cost about 80pounds ($150) and then I'd need an 850 as well. However, if I do manage to work something out or maybe borrow a modem I will attempt to log on from home. Can't promise anything mind! However, there's nothing to stop you writing to me (except lazyness of course!) if you need to contact me for some reason. Any email sent to me is likely not to be read until OCTOBER! Hi everyone,

I recently purchased a 810 disk drive with happy... it came with ver 5.2
of the HWA software....

Well, I tried it on the hardest disk I knew of to backup.... Realms of
Impossibility (seems to be double tracked... i.e. sector headers in the data
causing it to see one of two possible track/data configurations) and of course
it didn't work.....

Out of curiosity, what won't the Happy drive backup ?

Also, is there anything that will backup Realms.... ?

Also, while I'm at it, I have an original disk of One on One, but it is
messed up (fails the protection scheme). Would anyone be so kind as to
copy a good original back onto it with a happy enhanced drive so that my
original is restored.....

Thanks again,

-- Curt

Curt,

Electronic Arts software was always the most heavily protected software.
I don't think it was until the Happy 7.1 upgrade that Electronic Arts
would copy. I own Realm of Impossibility and I still haven't tried to
back it up. I just recently got a hold of the 7.1 upgrade for my 1050,
and so I don't know if it will even back up Realm.

Source record: 111052

okay gang, a while ago someone was asking about snapshot form CTH. later there was a post that said something to the effect that it would soon be posted to the archive. well, to make a long story short, I called CTH this afternoon and downloaded a snapshot15m.

snapshot only works with spartados 3.2. with this version, you can not use a ram disk if you only have 128k of memory. snapshot uses the upper 64k of memory to store a "picture" of your system as it currently is. while not multi tasking, it does let you run two different programs at once (i.e. bobterm and textpro).

as i understand it, for a s/w fee of $10, you can get a version of snapshot that will allow you to save 10 seperate images to your hard disk, for those of us that have them.

snap15m.arc should be in the archive by the time you read this, try it out,and send me your comments, I talked to Tom today and he is interested in wht you have to say.

the file is located in atari/8bit/new

I fooled around with it a couple of weeks ago on the NET. What you need to do is use a code block that will clear the stack for any recursive routines. I probably got it wrong, but I recall something like:

```
BYTE PASS
Proc Recursive()
IF PASS=1 then [$60 $60]
ELSE PASS=1
DO
<your stuff>
UNTIL <condition>
IF <notdone> Then Recursive()
FI
RETURN
Proc Main()
PASS=0
Recursive()
RETURN
```

Anyway, that's the general idea. Initializing the variable PASS before calling the routine & the PASS test are the only things necessary to make Action! recursive (able <g>) Whoops! just noticed I should'a added a FI after ELSE PASS=1.

Okay, I cleaned up the code a bit.. just what does the
[$60 $60] do ? According to my book, the $60 opcode is RTS.
PLA is $68 and PHA is $48.. .so I am confused as to what you are
actually trying to do that will make the Recursive PROCedure
Recursable. This would really help me out, there is a book I am
reading covering Computer Graphics. It has a fill routine that I
would like to use for lack of access to source code for a better one,
and it's a recursive call. Written in Pascal, the source is real
easy to port over to Action!

By the way, have you run into any TRIG functions to supplement the
REAL functions offered in the Toolkit? Maybe I can port the ones
that came with the Antic Floating Point Package for MAC/65, but if somebody
already wrote them, why reinvent the wheel?

ARRRGGGHHH! I should have know better then reply online! Your right, it's $68 vs $60. But then here I go again so 2X check everything I say if you want to be sure. Some of it is guess. All procedures in Action! are equate to the address of the subroutine. For example, if you want to find out where & how MoveBlock is & works in the CART you'd "PRINTCE(MOVEBLOCK)" this will give you the address of the routine in the cart & you can do a memory dump via the * operator in the monitor or save to disk until you find an RTS for later dissasembly. The manual states that parameters are passed via [a,x,y] reg(s) then mem loc $A3, $A4,... what else goes on is if the parameters passed in regs have to be used they are stored in $A0, $A1, $A2, so they can be used for indirect addressing. When you compile a program the compiler decides how many parameters are passed & does a bit of code to get the job done, then just does a JSR <mem loc MoveBlock> MoveBlock assumes the low byte of DEST is in A reg, high byte DEST in X reg, low byte SOURCE is in Y reg, high byte SOURCE is at $A3, low byte/high byte of SIZE is at $A4/$A5. A RETURN is just compiled to a $60 so a finished Action! program is just a series of JSR <address> with a RTS at the end of the subroutines. So if you don't hit a RETURN by being recursive, you have to clear the stack.

The program Snapshot15m works exellect with many programs and
will work with an unmodified 130xe but more memory is better (like
Rambo XL) but the SnapShot 3.0d is THE best for HDs and 1meg MIOs
I'm using it write now with BT1.22 and when I'm finished here I'll
hit sh^4 and my Oasis 4.7 BBS will come back online in 2 sec.
Using my mio is 3 times faster than my HD.(w/6sec.loading).
The neat part about it is if the phone rings while I'm doing some-
thing else with the computer I only have to hit sh^4 to go back to
the BBS. (in 2 sec. to catch the ring) I always leave on the wait
screen.
I uploaded the snapshot3.0d file to the umich archive but it came
back as undeliverable address...I guess yfn (where I'm calling from)
does not permit me to type the last 4 char. of th e address in the
address jrd@ston
I WILL UPLOAD IT HERE IF ANYONE WANTS IT.

I believe that Action! does no dynamic allocation of variables (except possibly for the arguments to functions), so most uses of recursion will not work. Try it and see, anyway.

Message-ID: <1992Jun7.162410.11602@exu.ericsson.se>
Source record: 110961

No, Action! does not allow recursion. If you look at the generated
code for a procedure or function you'll see it starts like this:

JMP StartOfRoutine

--- garbage here ---

StartofRoutine

The JMP is to skip the area used by local variables for the
subroutine. This area is fixed, as it is in FORTRAN. If you
call the same routine again, the local variables will be
overwritten. I belive that Action! passes parameters in
this area as well, but I don't remember exactly.

Something else to keep in mind for heavily recursive functions
like a seed fill is that the 6502 runtime stack is only 256
bytes. So after 128 levels of recursion (very easy in a seed
fill) you're in big trouble.

There was an interesting paint program printed in ANALOG
which used a similar algorithm, though I'm sure they maintained
their own stack in software. It wasn't BBK Artist--something
like the Graphics 7/10 Painter which appeared when ANALOG
was still in its teens.

Hope this helps.

2216. 600xl memory upgrades

Newsgroup: comp.sys.atari.8bit
Date: 1992-06-07 19:15:12 UTC
From: tgreen@iastate.edu
Message-ID: <tgreen.707944512@vincent1.iastate.edu>
Source record: 110962

I recently got a 600xl cheap, and I'm wondering what it'll
take to upgrade it to 64K or 256K. It looks to me as if
I should be able to drop in the 64K upgrade (using two
tms4464-150 ics), but the 256K might be more involved.
So can I just put in the 4464 ics, or is something else
needed?

From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <60235@cup.portal.com>
Source record: 110963

James, the code block [$68 $68] will take care of the stack. As far as variables go I 'think' the 1st thing an Action! progam calls before it goes to a PROC or FUNC is an internal routine called Copy_Parms or something like that. Ergo is you have to have all local variables preserved/updated you should just be able to pass them back in the call to make sure they get there safely. I did an integer square root function that called itself W/O any problems. You are correct on the stack W/O the code block: crashes badly after a few iterations. Side's, there's nothing a mere compiler can do that a M/L Wiz like you couldn't undo right? <g> Still own your 8-bit?

Well, I am not only looking for a fill routine for a standard graphics
screen, but to fill an object drawn on a virtual printed page in memory,
which could be up to 1530x1980 pixels. Obviously, a 256K machine is
required, as is a custom fill routine. Realistically, only relatively
small objects would be filled, else it would probably take forever for
the fills to be completed. Anyhow, got any good fill routines then that
aren't recursvie? Guess I will have to work on one.

Source record: 110972

To: !umn-cs!exuhag@exu.ericsson.se(James Hague)

Well, I hope I got this adress right.
Im the person you replied to in Net-mail awhile ago. Since then I tried
replying the same way but there are some reasons I cant do that. One is that
this is a privatly owned board and the sysop has to pay the LD charge himself.
Anyhow I reposted this reply numerous times so Im not going to say much more and
instead ill just give you the reply I preserved for you on disk now(Im going to
transfer it to the message).
here it goes:
I did'nt realize you made games
for various magazines. Ill try to
look for those magazines.

Im in the process of making a
Player/Missile editor myself. Its
comming along fine. The editor
itself works great. all I need to do
now is write a functioning main menu
and change the editor to allow
multiple images (for animation).
this will be a usefull program
because the editing is done on the
P/M'S Themself thus allowing
creation of any P/M combination and
overlap. No character set maker can
do that. I plan to keep this program
for my own use when its done. maybe
after awhile Ill release it as PD.

Id be interested in any tips you
could give me for game programming.
Someone with your experience and
backround aught to know alot about
using DLI's, VBI's, and scrolling.
I dont have a specific question
but ill think of something later.

By the way, my P/M maker program is
in 'Action!'. Thats what im using
mostly. Recently, at my club I got
'Atari macro assembler'. I hav'nt
used it yet but I only bought it
cause there was a book with it that
I really wanted. It was cheap too.

Bye.

2226. Help! My 800XL is DEAD!

Newsgroup: comp.sys.atari.8bit
Date: 1992-06-08 13:24:46 UTC
From: tmkk@uiuc.edu
Message-ID: <BpJ3xB.L53@news.cso.uiuc.edu>
Source record: 110970

There I was, sitting in front of my Trusty and faithful 8 bit, which had served me well since 1985 (when it replaced a 600XL), ready to boot up The Return of Heracles after a long hiatus, when all of a sudden the machine simply died. Now when it powers up all I get is a black screen and a small "chirp" from the speaker, then nothing.

Anyone out there with an 800 or 800XL they're interested in selling to help out a fellow Atarian? Barring that, are there any places still around which would be able to repair it?

All advice would be most welcome. Thank you!

I remember paying $395 for the Atari 400 in 1982.
16k and a membrane keyboard to boot...
Just the computer, no basic cartridge, or cassette.
I think I remember buying a separate
package with the 410 and the basic cartidge. Something around $90-100.
Still have it - upgraded to 48k and built my own keyboard - and it has
never given me any problems...

Source record: 110986

Well, I ported the MAC/65 floating point Trig functions SIN and COS
over to Action!...and they are horribly slow. I noticed that even in
assembly, the demo's ran slow... lots slower than even my BASIC XL can
calculate the same SIN values. I don't really know what gives,
the BASIC programmers must have done a terrific job creating a fast
TRIG engine... whereas these MAC/65 macros are horribly inefficient.

I think I will look for those CORDIC rotators articles somebody mentioned
a while ago.
Are there any other suggestions? If anybody is interested, I can post
my TRIG.ACT routines to here... not to A.A. though.

Jeff McWilliams

2235. Going home tomorrow!

Just another quick reminder that I am going home tomorrow for my 16weeks summer holiday. During this time I will have no email or net access. Email sent to me will probably not be read until October. I will try and borrow a modem and attempt to log on, but I can't guarantee this.

As for Digi-Studio, well I will be contacting KO software very soon offering them distribution rights for the US. Let's hope it comes off! If it works then I'm sure some kind sole would be able to let you all know on the net! In the meantime, copies are still available from me direct. Send $25 cash or 10pounds cash to me at the address given below. Please use international registered post. Any loss of funds is not my responsibility.

I will no-boubt finish issue 6 of the news-disk during the summer, so I will try and arrange it so that somebody can get it up at the archive for you all.

Here are my home details:

address:
DEAN GARRAGHTY
62 THOMSON AVE
BALBY
DONCASTER
DN4 0NU
ENGLAND

phone:
+(0)-302-855-026

See you all at the start of October, hopefully sooner! Bye for now!

Dean Garraghty.

2236. SEEPIC at the archive

Newsgroup: comp.sys.atari.8bit
Date: 1992-06-09 14:36:54 UTC
From: djg0@aber.ac.uk
Message-ID: <1992Jun9.143654.26031@aber.ac.uk>
Source record: 110985

As promised a while back, I have uploaded SEEPIC to the archive. It is currently in "new" and is called seepic.arc. Format a SD disk and put a copy of DOS 2.5 DOS.SYS on before unARCing. Boot with Basic. I have also put a few .PIC files in the archive as well. The last one will give a CRC error because my RAM disk ran out of room so it didn't fit in the ARC file!

Seepic is easy to use. It takes a directory of the disk looking for .PIC, .PI8, and .PI9 files. .PIC is for Atari/Koala/Micropainter files, .PI8 is for mode 8 files, and .PI9 is for digitized pictures and so forth. To get the help screen just press ? after a directory has been taken. Select pictures by pressing the relevant key from the menu of files. SEEPIC decides what sort of picture it is from the extender, but you can change modes by using CTRL and 7,8,9. 7 for normal .PIC colour pictures, 8 for mode 8, and 9 for mode 9. On mode 8 you can press the inverse key to change black to white, and white to black. To print the picture just hold down START. SEEPIC outputs to Epson and XMM801 printers. No need to tell it which you are using. SEEPIC just prints whatever it has on the screen regardless of what mode it's actually in! For .PIC colour files you can select what types of shades you want to represent the various colour registers. SEEPIC is a great program! Have a fiddle with it!

Dean Garraghty.

Do these actually do math, or are they simple table lookup
routines?

Re: action! being non-recursive sucks, so what? It was a compromise.
If you want a recursive language, use C, but be prepared for a big
performance hit. Trying to run a stack driven language on a machine
with no hardware stack per se (and implementing one in software)
sucks more than action! not being recursive.

Use look-up tables if you don't need real strict accuracy. It's as
fast as you're going to get and gives you 95% of the functionality.
I had the same problem defining a parabola once and the table worked
dandy.

2240. News-Disk files

Newsgroup: comp.sys.atari.8bit
Date: 1992-06-09 23:22:20 UTC
From: bmarcum@world.std.com
Message-ID: <BpLq98.DHJ@world.std.com>
Source record: 110989

I downloaded the News-Disk files from the archive, but there seems to be something wrong with issue4.arc. It unarcs okay, but the filenames don't match the contents of the files. The sampled sound file seems to be missing; other than that, all the files are there, but under different names. I wrote e-mail to Dean Garraghty, but then I saw his post that he was going to be off the net until October.

The other News-disk files were fine, and I recommend getting them.

The only problem I have had with freezing when snapping between
different Snapshots is from Bobterm if I don't exit out of it first! I
think it is something to do with the r-handler it loads but I wouldn't
be sure about that! I use a 256k rambo 800xl with a Blackbox that has
it's own r-handler. Joseph you never did reply to my email asking you
about your Oasis 4.7 BBS and whether or not you were OasisNetting with
any other Oasis BBS's?

says:
>
>
> Do these actually do math, or are they simple table lookup
>routines?
>
No, they actually do math, it makes calls to the Floating Point
package in the Atari O.S. to do multiplacation, div. adds, etc.
to approximate the COS/SIN functions within a degree of error not
noticeable given the number of significant digits the floating point
package supports. But the lookup table is actually probably the way
I am going to implement the SIN/COS functions... since I am
basically using the Trig functions in an object rotation
subroutine... where the angle of rotation is limited to
45 degree increments.. a look-up table of this size is easy to handle.

I looked up those two CORDIC Rotator articles today. They really blew
me away. For someone having math up to Differential Equations,
the theory kinda lost me. THe older article had some program code
written in BASIC. Since BASIC doesn't support variable types, I wasn't
sure what was Integer and which were F.P. variables.
The article in Dr. Dobbs Journal had a sample in C. But it used
32 bits to represent the floating point number, and some other syntax
that really didn't make much sense to me. Converting the number
as it is represented by the 32bit word into something useable by Action
seems a little difficult. Perhaps I should quit pretending to be
a computer programming guru.. some of this stuff seems a bit out of
my league, or else I am just too lazy to really sit down and
dig into the stuff....

>Re: action! being non-recursive sucks, so what? It was a compromise.
>If you want a recursive language, use C, but be prepared for a big
>performance hit. Trying to run a stack driven language on a machine
>with no hardware stack per se (and implementing one in software)
>sucks more than action! not being recursive.

Yeah, I agree, Action! sure has the speed without having to program
in straight assembly language. The tradeoff just means not being
able to use some ready-to-run code samples and having to reinvent
some algorithms, like the aforementioned area fill algorithm.

It must have something to do with the r-handler built into the BlackBox, even as we speak, I'm swithching between Bobterm, Kermit (Yeah I know, but it was already saved as immage 3) and TextPro 4.56. (I'm using the 10 image version of snapshot SNHD30) The only trouble I have had is that Bobterm will resend the macro attached the image hot key (sh-ctrl-1). Other than that, I've had no troubles with the program. I might also say that I'm using an MIO.... That may have something to do with it, I'd been told that the BlackBox and MIO handle the R-handler differently.

If your interested, I'll send the hard drive version of snapshot to the Atari Archive

I got fortha.arc and forthb.arc (antics figforth?) and have
(from atari.archive.umcich.edu)
become enamoured of this language. These particular implementations
are not working well for me; crashing after VLIST, and failing
to load many screens on the smaller kernel. Also, I mainly use
spartados with us doubler on my lone 1050. This pd forth is
designed around single density dos2 of some sort. There are no
files, screens being stored on contiguous blocks of sectors.?
The gist:
What other forth implementations can I get? Can I get something
to work with sparta and us doubler?
How about a forth kernel source code that I could modify
and implement myself (assembly).

Set.

ps. Any help or information would be greatly apreciated; it amazes
me that so much interest remains for atari 8bits.
pps. Ive had and used my 800 scince the early 80s, with no problems.
I still use it nightly as a terminal and for any computing
problems that might arise. Who need ask for more?
(ob. testimonial)

Umm... did you say 45 degrees? Throw the trig out! There are only five possible values you can be dealing with: -1, -sqr(2)/2, 0, sqr(2)/2, and 1. If this isn't a case for table lookup, I don't know what is. In fact, don't even bother with floating point. I really doubt you'll need it. Isn't your project dealing with a virtual screen in RAM, somewhat less than 2k by 2k? Like, FX-80 fullpage high density print, perhaps? Scaled 16-bit numbers should do nicely.

From: nick@sw.stratus.com
Message-ID: <3765@transfer.stratus.com>
Source record: 110998

When I still had the time to hack on the 800, I used to use Forth exclusively. I used ValForth, which had a very good development package. I don't know what the state of the company or the product is, but if you can find it, I can recommend it.

I always used it with drives in single density mode, so I never saw any problems and can't offer any advice.

If you want sources, the Forths you have are both based on the original Fig-Forth put out by the Forth Interest Group. I believe that if you join, they should be able to send you a copy of their Forth with sources. They also have an enormous Forth library. I don't have their address with me, but if you post a query to comp.lang.forth, I'm sure you will get a reply.

I hope you find Forth as enjoyable as I did. There is a learning curve involved with the language that discourages a lot of people the first time they pick it up. (I did that. The first time I looked at it I didn't like it. I got so frustrated at the other available tools for the 800 that I eventually picked it up again, and never put it down.) Once you get through the curve, you'll have a hard time going back to compiled languages.

/nt

I don't speak for Stratus Computer Inc.

2251. Request for help

Message-ID: <3768@transfer.stratus.com>
Source record: 110999

A couple of years ago, before I had internet access, I had a friend of mine post an article stating that I had written an interactive Forth debugger, and would be willing to distribute it to anyone who wanted it, but I could not upload it because I had no modem for my 800. To my slight surprise, I got 2 responses to my offer, and I sent each a disk, with the program and some documentation.

I was hoping that one of the gentlemen would upload the program to the archive at umich, but I don't see any evidence that it happened. (If it is there, and I've overlooked it, could someone point it out to me?)

In any case, I'd like to have the program uploaded so I can archive it and maybe port it to some other systems. Unfortunately, I still lack a modem, and have no plans to buy one because I hardly ever use my system for anything other than game playing anymore. Would anyone with a modem be willing to upload it to their system and email it to me if I send them a floppy with the file? I'd really appreciate it.

Please reply to me if you can do it. Thanks.

MYDOS 4.x has one built in, and it just requires a few keystrokes (and a
RAMdisk with at least as many sectors free as are used on the disk you want
to optimize):

C
1 8
I
1/N
C
8 1

And you're done!

I did some serious thinking about doing the same thing a while ago.
The biggest hurdle will be how to bring out the cartridge port
to somewhere in front so that you can pop carts in and out.
Or maybe you are like me, and don't switch carts much. I usually always
run a stack of RTIME8, Sparta-X, and BASIC XL. Bob Woolley talked
about bringing out the cart port so that you had an edge connector
in one of the floppy drive bays. But you have to be very careful with
making a ribbon cable that runs from the computer to the edge connector.
I recall several reports of the cartridge port being very finnicky
about long cables. Now we're back to the cable length problem that
Ben Poehland talked about.

By the way Rick, I didn't know you were an SLCC member. SO am I, just
a long distance one. Maybe SOMEDAY I'll get to a meeting. :)

Sherry...I just sent Snsht30d.uue (ARCed) to the archive a couple
of days ago....I didn't get it back this time so it must have
worked this time. I am using the MIO also and I have no trouble
at all with snapping in and out of any program (ecpt AWP3.0 just
goes bonkers). The only drawback in using Bobterm and Snapshot
is you can't use the sh^# keys for macros but you can use the
other macro keys unnm
other macro keys under [J] on the main menu.
Snapshot15m will work with Bobterm if you get the "Rehacked"
program from CTH.

I've played around with Fig Forth in the past. I seem to recall there were some compatibility problems with XLs, but they could be fixed. And, I listed the disk I/O routines and found you could use double density if you added a certain constant to the block number (it was either $2000, $4000 or $8000; of course you don't use the dollar sign in Forth). The boot routine might have to be rewritten to boot from a DD disk.

Alas, the 'screens' concept in Forth is too low level. I've seen Forth's
on more modern systems which have a file system interface, much nicer.
All the Forths I've seen on the 8-bit were screen oriented. One of the
ValForth modules did give you an interface to Atari's DOS so you could
do files, though.

Forth is definitely a neat language and very fast. I think most people
get kind of freaked out over the RPN and shy away. Sigh. This makes me
want to go home, dig the old 8-bit out of the closet and fire up
ValForth!

Has anyone heard of this? I remember it being said that the resulting disk is in DD Sparta format (not sure whether skewed . . .). If so, what's the name and where can I find it? (Need it quick; school year ending quickly.)

The computer was getting power - the power LED came on, and the screen changed to the black you see when you first power up but before the blue GR. 0 screen comes up. Fortunately, I found a place nearby that still repairs Atari 8bits. The bad news is it's likely to cost me $80! :-/

The lengths I go to play Ali Baba... ;-)

Yes, I have heard of this. In fact, there are TWO versions, one of which
is called, oddly enough, ATARIO. I forget the name of the other. Both
allow an IBM PC's 360K floppy drive to read and write Atari 8-bit format
disks (in DD format, as I recall). In my experience, the reliability is
not the best, but that may be attributable to either my Indus GT or my
XT's floppies being out of alignment after all these years (or both).

If people are interested in this file, suggest an anonymous ftp site
somewhere. I'll go home tonight and see if I can find the program. If I
can, I'll upload it to that ftp site. Preferably a site that allows
people to send in email requests, since there are alway people who don't
have ftp and I don't have the time to email out copies to a bunch of
people. Or, if it's small enough, maybe I'll just post it here.

You're right. I was looking under the atari/languages directory, not the
8-bit directory. Sorry.

Hmm, this sounds like a similar problem a friend of mine had on his 800xl.
We Opened it up and swapped many a chip, the problems came down to a Single
64k DRAM being burnt out. We replaced the chip and everything is fine and
dandy. [Costed less than $2 to fix]

I'm posting this for a friend without access to the net.

He's collecting old 8-bit items and are looking for the following:

ComputerEyes digitizer (PAL version!!!)
StarFleet I (must be original w/box)
Atari Lightpen

Anyone who has these items or anyone with info about where to get them,
please mail me at jonal@sofus.dhhalden.no.

Thanks!

I am interested in purchasing cartrige games for the Atari 800 line of computer. All games titles considered. Reasonable prices only. No docs necessary.

Ihave some items for sale:

Atari 1050 with US Doubler power, IO, box $75.00
Atari 850 interface no power or IO $30.00
Atari 850 interface w/power & IO $40.00

100 or so Atari disks. Some original games with docs, some not...Most seem to work. Backups of 5 years of Atari BBS operations.
$$Make offer

Atari related books:

DeRe for the Atari
Mapping the Atari
Technical referance manual
Atari BASIC
400-800 Firld Service Manual
SpartaDos COnstruction Set (Manual and Disks)
Books $25.00

Monkey Wrench II right hand cart for the 800 computer
with docs $10.00

Shipping not included....Email to seanm@terapin.com

The mail link is not always working, so try a couple of times if ya bounce.

Atario and util are in the archive at umich.edu. FTP to atari.archive.umich.edu or send mail to atari@atari.archive.umich.edu . The file names are 8bit/atario.arc and 8bit/util.arc (There are a lot of other files with names beginning with "util". Don't know if those are source code or different versions of the program). Not having an IBM compatible, I've never used either of these programs. As I understand it, they use double-density Mydos format, not Sparta format. I have heard of a program for IBMs to read Sparta format disks, but I'm not sure what it's called.

Just a note on the Black Box form CSS..
I recently purchased one, along with the Floppy Board and a Xebec controller card.
We all know what great products these are, but I have to add one thing..
CSS stands behind their stuff! I had some problems getting started with my new setup, problems that required CSS to UPS me several replacements..they did it at their own cost and no questions asked!
They could have said "Hey you blew your chips out..tough dookey"
BUT THEY DIDN'T..They took care of me, and I am letting you all know about it..
If you had any doubts about making a purchase from these guys, give it a rest..They're cool..
Joe

Hmmmm..... I see my program has brought me little fame. SpartaRead reads
SpartaDOS format disks on a PC. I placed it in all the popular places,
but have gotten little response on whether or not people even use it.
Since I'm out of the 8bit business for a while, I'd be willing to give
the source code to someone who's interested in adding WRITing functionality
for it.

(If you're looking for the file, check for SR.ZIP or SR.ARC or something...)

Source record: 110921

Okay, I checked the Atari archive and did not see the hard drive version of SnapShot. It's now available in atari/8bit/new.

Something else of interest, I can't remember if it was discussed here or on another net but, someone was asking about a program to backup a hard drive (or MIO). There is a file on CIS called Alfback that will backup you entire hard drive. As soon as I test it out, I'll be sending it too to the archive.

Let me know if there is any interest, if not I'll just hang on to it and save space at UMich.....

Talk to y'all later

Mike...

BTW if anyone has a Diamond cart that they would like to sell, please drop me a note, I'd like to add it to the Atari collection at the WBUG archive here in Louisiana.

Thanks....

Just one more thing to add... you must use true 360K drives; no 720 or 1.44HD.
And you have to have a U.S. Doubler, Happy, or a clone of one of these if you
own a 1050 since the prog works in DD.
Hope I'm not treading on old terf.

The cart shouldn't be a problem. I'd be running a BBS off of the one I case, so I shouldnt have to mess with the cart port. Some of the problems I see would be rigging the powersupplies up. I'd like to run the whole thing off of one power supply, but since the drive must be powered up before the computer I'm stuck with two. Which leads me to a question. Does a hard drive have to be powered up before the computer, or can things routed thru the par. bus be powered up at the same time?

In answer to the power up question, the Hard Drive needs to spin up to speed before either the Black Box or MIO are powered on, and the computer can't be turned on before the Black Box or MIO. You could wire in a delay line for the computer... the TKFREEZE circuit that supplements a Transkey Atari has an adjustable power-up delay.

Source record: 110931

Just thought I'd let everyone know that UTIL will read and write files to Atari 3.5" DSDD disks (720K) in MYDOS format as well.... (I do this since I do not have a 360K drive on my PC, and I do have a 3.5" on my ATR8000 on my Atari....)

I'm not sure if the current program has the following two bugs (or flaws):

1. Switches have to be in uppercase to work... no error is generated if lower case is given, and the program doesnt work right if lower case is given... leading you to believe that the program doesnt work...

2. Does a disk reset call on the PC before every write... this causes the drive heads to go to track 0 then to the desired track and do the write... which happens for all 9*2*80 sectors (if all are used).... not quick, and not nice for the PC drive.... If this is not corrected in the version on atari.archive.umich.edu, I will correct it, recomple, and post, and upload.... (ssometime....:-)

Later,

> Are there any other suggestions? If anybody is interested, I can post
> my TRIG.ACT routines to here... not to A.A. though.

You could create some fast trig functions by using the TAYLOR-series.
I'm terribly bad in maths but I think the SIN function would be like

sin(x):=x-x*x*x/3!+x*x*x*x*x/5!-x*x*x*x*x*x*x/7!+- ..etc.

please correct me if the above equation is wrong. It should be easy
to implement this in Action!. It isn't necessary to continue the
approximation. The above calculation will provide an accuracy up
to 7-9 decimals or better.

Some weeks ago I downloaded issue4.arc and it was fine. The sampled
sound file was included and I've had no problems with nonmatching
filenames. Try to download it again, probably your copy got corrupted
while downloading.
I also recommend getting all News-disk files. They are interesting.

Yes, all of the programs use double-density format. ATARIO can only
read 8-bit disks while UTIL can write, read and format.
But if you want the new version of UTIL.EXE than better get the file
DSKUTIL.ARC. This file contains a debugged version of UTIL.EXE
with some well documented docs. I don't have Sparta-DOS but I think
somebody has uploaded a file named SR.ARC to the archive.
(SR stands for Sparta Read). The filename for DSKUTIL.ARC is
8bit/dskutil.arc at atari.archive.umich.edu (141.211.164.8).

Alright you 8-bit hardware experts out there, I've got one for you.

Im using my 800XL as a controller for my home sprinkler system. I added a battery backed real time clock so that the atari can turn on the sprinklers at 4:00AM. It works very well. The program is written in Turbo Basic. The problem is that if there is a power glitch then the thing dies and my lawn dries out while I'm away for 2 weeks. (Thats my fear anyway). As you all know if you turn on an atari and its disk drive simultaniously, the atari wont boot because it times out before the disk drive is ready. What can I do? I thought I could make a watch dog circuit which asserts the reset pin on the 6502 if the basic program that's running doesn't coutinuously toggle one of the joy stick pins. What do you experts think? If you assert the reset pin on the processor will this cause a cold boot of the whole system? Or will it just do what the reset button on the keyboard does (runs ROM basic and sits there in stupid mode)

Thanks,
Steve Coffin

CC: POEHLAND
Subj: Help! My 800XL is DEAD!

I concur with the response of the British Underghround Network person (whose header ran so long it was truncated from my copy).
The description of the dead 800XL sounds very much like what happened to me several years ago when I was burning-in a new RAMBO installation, one of the 256K memoeries did a self-destruct & the 800XL came up w/blank screen even tho the red LED was on.
It was very easy to find the offending chip. I opened up the case & removed the keyboard & shields (the computer will boot w/out the keyboard plugged in), turned it on & left it on for 10 min. Screen was black during this time.
After the warmup I started runing my fingers over chips. I came to a chip that burnt my finger (OUCH!!). Yup, it was a DRAM, it was so hot it was beginning to melt the socket. Replacement was simple, cost all of $2.50 (the going price for 256K DRAMs then), & since then no problem.
I think DRAMs can go any time, there seems no rhyme or reason to DRAM failure.

Sherry.....I have ALFBACK/ALFREST. I use to use it when backing
up my MIO. It took 1/2 hour to do it...lesseee..that works out to
15 hours to backup 30 megs!!
I'm jealous of those PC users who have hard drive optimizing
programs that get rid of all the file fragments and copy everything
back inorder in a very short time. I got a hard drive to save me
time and it really has but if I got to use alfback
I have to take a day off work to do it and another day to load it
back up.
Dunno what happened to the Snhd30d I sent...snhd30 and snhd30d are
2 different programs....the "d" program is better.

Source record: 110938

Speaking about the difference between a 130xe and the 800xl...
the ports in the back are different...you can plug the cable from
an MIO or BB straight in to the 800xl but you have to have an
adaptor plugged into the back of your xe cuz its the cartrige
port too.....I got mine from Best Computers for $16. It has 2
cart ports on top of it.

Ok I don't know if this will help you with your sprinklers but
get yourself a SpartaDos X cart....when the system goes down
(brown out) and then on again the computer doesn't have to boot
a diskbased dos. The first thing the cart does when is boots is
look for a config.sys file on the drive (thats already on) then
it looks for an autoexec.bat file. You can run anything you
want from the autoexec.bat file...and the xcart works with
Turbobasic too (not sparta3.2d disk based dos). To get the
correct time use the R-time-8 cart if you can find one...they
are no longer produced....or you said you had a clock with
battery backup???

>about long cables. Now we're back to the cable length problem that
>Ben Poehland talked about.
>
Talking about cable lengths etc. reminds me of a problem I had when I
first tried out my Blackbox. I was running a BBS at the time and wanted
a hard drive for it. I purchased a BB second hand and to cut a long
story short managed to get a hdd working just fine with it. I really
wanted to use it with my 130XE but I never could get the BB to work on
either of the two that I have. It worked with no problems at all on my 256k
Rambo 800XL but each time I removed the short parallel port cable (that
came with the BB) and plugged the BB into my XE I just kept on getting
all these extraneous characters on the BB menu and I couldn't get rid of
them! Anyone else using a BB ever had this problem at all?

In a previous article, JJMCWILL@MTUS5.BITNET (Jeff McWilliams) says:

>Okay, my Calc book says this is a Maclaurin Series. What's in a name though.
>
> x^3 x^5 x^7
>you say that SIN(x)=x- --- + --- - --- would yield a reasonable accuracy?
> 3! 5! 7!

Hello Jeff, I see you've found many an interesting things to keep you busy.
Anyways, You both are correct. It is a Maclaurin Series, however it has
a special name when c=0, and is called a Taylor Series.
The series, assuming it has a power series expansion is exactly what was
posted, but formally it is defined as:

sin(x) = Sigma [(-1^N) * X^(2n+1) / (2n+1)!] ; n=0 to infinity

This seems to work wonders, however It is only valid in certain cases.
I remember on my Calc_II Honors' final, we had to estimate SIN(y) where
y was somethig like 81 degrees, using Taylor's Formula and Lagrange's form
of the remainder term, accurate to 8 decimal places. Needless to say,
the task was simple, BUT the correct answer and the answer the calculator
gave were TWO totally Different Numbers.

My suggestion, is to go with the lookup tables for the fastest and most
accurate as well as easiest implimentation. But if you want, I can post up
the source code to Basic's SIN[X] and COS[X] functions, from The Atari Basic
Source Book.

Craig Lisowski [The BRiTiSH UnderGround Network person]

Nevermind the fact it says Tony Lang.

2294. Upgrading a 400 to 48K

Newsgroup: comp.sys.atari.8bit
Date: 1992-06-13 03:36:29 UTC
From: khan@mrcnext.cso.uiuc.edu
Message-ID: <BprM0u.5Er@news.cso.uiuc.edu>
Source record: 110943

I'm working on acquiring a used 400 to replace an 800XL that died a tragic death recently. The model in question is bone stock, which means it probably has the standard 16K of RAM (I don't know for certain, I haven't seen it yet). What I'm wondering is, what would be involved in upgrading this guy to 48K of RAM? I seem to dimly recall a scheme which used the original memory board but replaced the chips with 64K DRAMs (and perhaps cut some traces/added some jumper wires), but I could be wrong about that. So, how tough will it be to upgrade this guy? What's it likely to cost me?

Please email replies, since it's likely to be old hat to most of the readers of this group.

Thanks very much.

Craig,

Okay, thanks for the additional information. I do plan on only implementing a lookup table for this program, seeing how I only plan on supporting rotations in 45 degree increments. But who knows when there might be a future need for some fast, accurate TRIG functions without resorting to look-ups, which is why I am still interested in this.
Taking a look at the source code for the BASIC Trig functions would be great. Post away!

Jeff McWilliams

2296. Re: Action! trig functions

True, I thought you might want to look into this for further support.
Okay, after probing through my calc book and doing numerous calculations
to get an accuracy of 5 Decimal Places, you only need to extend the series
to n=3 or to x^7.

Here is the SIN(x) function in rough outline form [NO not the basic one]
Convert X from Degrees into Radians, this is the key, and then plug
into the formula and there you go... To Convert to radians, multiply by
Pi and divide by 180. [x = x * Pi/180]

```
x^3 x^5 x^7
Sin(x) = x - --- + --- - ---
3! 5! 7!
```

Here is the series for COS(x)

```
x^2 x^4 x^6
Cos(x) = 1 - --- + --- - ---
2! 4! 6!
```

[I think with the COS you'll also get 5 Decimal place accuracy,havn'T done
any calculations to check yet]

The Basic source code is a general entry for both SIN and COS, merely jumps
into the code 15 bytes for COS and start for SIN. They use several bizzare
tricks to do both within the same, and they also evaluate the series. It
might take me some time to post it up and make sure it contains everything
you need to understand.

Source record: 110946

I think I remember a simple delay circuit(???), that'd fill the bill. You just use a resistor/transistor/relay. Can't remember "good" values, but it's just:

```
+5V Power---:----------:
\ : relay contacts
resistor / \
\ +5V E
/ : :
---B:/
: :\
---- E to computer
Capacitor____ to relay coil
: : :
ground -----------------
```

The 1st E on top should'a been C for collector. What happens is the 5V power supply has to charge the LARGE value capacitor through the HIGH value resistor to a high enough voltage to turn on the transistor. You have to choose the resistor such that the transitor will have enough base drive to turn on the relay. Let's say you have a 300 ohm coil on the relay => at 5V it'll draw about 130 mamps. Most small current transistors have a forward transfer of 10 to 200 times their base current so ignoring the forward voltage drops & assuming about a 40X amplification, the maximum value for the resistor to deliver 3.25 mamps is 1.5K ohms. If you're using a different tap off the power supplies adjust accordingly. The capacitor should be a fairly large electrolytic. Just guessing, but 50 to 100 micro Farad. Whoops! make that a 30 ohm coil above for the relay! Looks about right other then that.

2300. Re: The Top #3 demo

Have you checked out the power supply? If it is an XL, they need to have exactly 5v on their pins... If not, they will do everything from what you discribe to having wild screen dances.... If it is just the PS, there are alo of possibilities. All ya need is a volt meter to check it. The original PS tells ya the pin outs I think on the top of the case for the DIN plug.

Source record: 110945

Two days ago I've uploaded the file 'top3demo.dcm' to the archive.
This is a really great demo I wanted to part with you. Some of you
should still remember the 'Das_Omen' demo we used to talk about a while
ago. 'The Top #3' demo is the response to 'Das_Omen'. Remember the
dancing girl in 'Das_Omen'? Then you should see the animation on this
one. It supports the 128K of a 130XE so not upgraded users won't see
everything. Anyway the demo says it uses 444KB of packed graphics data
stored in 128K being depacked real time. It is great!
Another demo on this disk shows more than 100 balls flying around on
the screen forming interesting figures.
This disk contains some more interesting demos. When you are fed up
with watching one demo then press the 'SHIFT'-key to go on with the
following.

I hope you'll enjoy it like I did.

I have the following complete system forsale. THE SYSTEM IS CURRENTLY
compatible with ST software, PC software, and is ready for MAC emulation,
and ATARI transformer. READS AND WRITES 720K PC/AT disks, and ST formats
also.

*ATARI 520STfm with 1 meg RAM, 720K internal 3.5" Drive
With internal clock and calender, keyboard
anti-static pad, 9 pin extender for easy access, and
TopCase Cooling FAN (LOW NOISE) for the POWER SUPPLY
SPECS:
MC68000-8Mhz 32 BIT internal/16 BIT arch.
MIDI IN/OUT
RS-232 port, Parallel port, HARD DISK PORT,
Floppy Disk port, TV port.
ROM cartridge port
VIDEO RGB/MONO PORT
VIDEO card built in for low, medium, and high rez.
Emulates MAC with GCR 30% faster than the MAC
(GCR not included)

*BEST MOUSE (2-button oval shape) w/pad

*External 360K drive

*RGB color monitor ATARI 1124 w/ swival monitor stand

*External HardDrive Case with Power Supply (Ready for HD)

*about 400 3.5" 720K floppies with case holders.
Many titles that still have original boxes.

Such Titles as:

PC-Ditto software.
SPACE ACE
WAR IN THE MIDDLE EARTH
FIRST WORD
SHADOWGATE
BAAL
WAR CONSTRUCTION SET
OGRE
OBLITERATOR
THE PAWN
and more...

*BOOKS such as GEM programmers reference from ABACUS
MANUALS, MAGAZINES, AND ORIGINAL BOXES are included.

BUYER GETS EVERYTHING ... $600.00

From: jwf10@ccc.amdahl.com
Message-ID: <54PJ02JX16F401@JUTS.ccc.amdahl.com>
Source record: 110953

Here is some info I saved from awhile back...

>From: JACS_NJ!Willi_Kusche@mast.citadel.moundst.mn.org
As a result of input from Robert Anisko, Kevin White and others, I was able
to get my hands on three versions of programs that can read Atari 800
diskettes on the drives in XT/AT class MS/DOS systems.
From Bob Puff's BBS, at (716) 247-8355, I got ATARIIBM.ZIP. That has source
in "C" and assembly.
From the PartTime BBS, at (216) 582-1196, I got AT2IBM.ARC. That has source
in Turbo Pascal and is a result of minor modifications to the source
available in ATARIO.ARC. These modifications were made by Kevin White.
From the JACS BBS, at (609) 346-1224, I got ATARIO.ARC. This is apparently
the grand-daddy of this kind of program. Source is Turbo Pascal.
Once again, thanks to all the people that assisted me in tracking down these
files.
....
All three archive files mentioned in my prior message about reading Atari 8
bit diskettes on an MS/DOS system equipped with a 5 1/4 inch drive are now
available on the JACS_NJ BBS, at (609) 346-1224.

Hope this helps someone.

2308. Re: IBM prog to write 8-bit disks??

Source record: 110855

I have the Happy Enhancement for my 1050. The retailer told me
that if I formated a 5.25" in single sided 360k format from my IBM I could
read and write to it from my 1050 (and IBM too I assume). Why would
I need atario or any of these other programs? Especially if they require
Happy Enhancement which this retailer told me could allready do this?
Can't Happy Enhancement alone do the job?

2309. Re: IBM prog to write 8-bit disks??

Newsgroup: comp.sys.atari.8bit

In article <55pK02n=16EQ01@JUTS.ccc.amdahl.com>, jwf10@ccc.amdahl.com (John Ferrell Jr) says:
>
>I have the Happy Enhancement for my 1050. The retailer told me
>that if I formated a 5.25" in single sided 360k format from my IBM I could
>read and write to it from my 1050 (and IBM too I assume). Why would
>I need atario or any of these other programs? Especially if they require
>Happy Enhancement which this retailer told me could allready do this?
>Can't Happy Enhancement alone do the job?

The Happy 1050 drive can read IBM disks that are single sided 180K format. 360K is usually double sided, so I guess by saying single sided 360K format he really meant 180K.
This is done using a different program that comes on the Happy 7.10 disk that allows file transfer to/from IBM disks.

You are absolutely correct, if you own the Happy and that program, you do not need a program like Atario. But if you do not own a Happy drive, then these programs allow your IBM computer to read/write to your Atari formatted disks.

2311. Action! Question... [FP]

Newsgroup: comp.sys.atari.8bit
Date: 1992-06-14 22:59:01 UTC
From: ai792@cleveland.Freenet.Edu
Message-ID: <1992Jun14.225901.26233@usenet.ins.cwru.edu>
Source record: 110859

In particular to Jeff,

Does Action wipe out the Floating Point Routines in Rom/ram area
of $D800 - $E000 ? If not then the Sin/Cos function will work perfectly,
if not, then it'll have to be implemented somehow. The Atari Basic Routine
of Sin/Cos is quite simple now that I took a good look at it, but it makes
use of Floating Point Routines such as FLDxR, FDIV, FMOVE, FSUB, FST0R, FMUL,
and PLYEVL. (x = 0 and 1).

Soon, the source will be posted up here, with (IMO) better documentation and
comments to see what exactly is going on.

2312. Atari Age Magazines

Newsgroup: comp.sys.atari.8bit
Date: 1992-06-15 00:05:49 UTC
From: omf@tiamat.hacks.arizona.edu
Message-ID: <15JUN92000549@tiamat.hacks.arizona.edu>
Source record: 110868
Cross-posted to: rec.games.video,comp.sys.atari.8bit

Hi folks, I have every issue of Atari Age published (as far as I know).
Atari Age was "The Official Publication of the Atari Club". It listed
all the games coming out for the 2600, and latter the 5200 and 7800.
Interesting reviews and facinating Atari news that never materialized.
(Did you know Atari was working on a telecommunications system called
AtariTel? How about the 'mind-control' device that would let you
play games by thinking your actions? Atari was also working on a
system called Jaguar which would be the newest and best in video games.
Sound familiar?)

Anyway, I'd like to know if anyone is interested in buying these from
me. Issues go from Volume 1, Number 1 (MAY/JUNE 1982) through to
Volume 2, Number 5 (MARCH/APRIL 1984).

Please contact me at any of the following addresses if you are
seriously interested:

2313. Hacker Tools

Newsgroup: comp.sys.atari.8bit
Date: 1992-06-15 00:22:31 UTC
From: khan@mrcnext.cso.uiuc.edu
Message-ID: <Bpv2DL.G8n@news.cso.uiuc.edu>
Source record: 110860

I'm interested in finding out about hacker tools for the 8 bits (assemblers, disassemblers, compilers, debuggers, monitors, etc.) What are the tools people are using these days?

Also, has anyone tried to come up with a cross development system so we can use our fast '386-based IBM clones to QUICKLY assemble/compile programs which will then run on our 8 bits, either after transfer over a serial link, via floppy swap, or by direct connection using somehting like the SIO2PC interface? It seems like the CC65 source code available on umich would make a good starting point for such a system...

Scott,

Dataque WAS working on a C compiler, and the original version was actually a cross compiler that ran on the IBM. You'll have to look up the adress and phone number elsewhere... I don't have it handy.
Debuggers I have personally used included OmnimonXL, which is built into an alternate OS ROM chip, and Extended DDT which was available from Antic, as well as Debug+ which was from Analog computing. The most system bullet proof was Omnimon XL since it resides in ROM. The black box apparantly comes with an excellent machine language monitor/debugger, which is more bullet proof than Omnimon XL is.

2317. The Top #3

Newsgroup: comp.sys.atari.8bit
Date: 1992-06-15 04:43:02 UTC
From: a644690c@edinboro.edu
Message-ID: <0095C1CD05367840.2180789C@edinboro.edu>
Source record: 110862

I just read that the Top Demo part III has been uploaded to the Archives. NTSC users NOTE: Most demos on this disk REQUIRE PAL Video to function properly. I came across this demo a little over a year ago and I was only able to get through three or four demo screens (and even they were flaky). I soon discovered that there were many more demos screens on this disk, so I spent a couple hours and did some sector hacking. I rearranged the loading sequence and left out the screens that locked up my machine. You will never get to the really cool screens if you don't skip a few 'crashers'. (Oh, Yes there is more after 'Video Worm'. I think it is just the closing credits though).

The hack really just involves one sector. For those with sector editing experience, I will post a few Hex Dumps of the proper sector for different loading arrangements. (I have not found any way to see all the screens on a single loading sequence because some of the cool ones won't let you continue).

Let me know if anyone wants more info.

--- HARDWARE ---

Atari 820 Printer $18
Notes:
This is an old 40-column dot matrix printer. Useful
for program listings.

Atari 1020 Plotter $9
Includes:
SIO Cable
Power supply
Cassette software

Atari 1010 Cassette Recorder $8
Includes:
Power supply

Atari XM301 Modem $2
Includes:
Manual and software
Notes:
This little guy does not have a case! I removed it
several years back to put it inside my 800XL, which worked
fine until I got a 2400 baud modem. You'll have to
figure-out the pin-outs on the SIO cable, but I'm pretty
sure it works. You may want to get the next item on the list

if you pick this up.

SIO Cable with only one connector. $1
Notes:
For hardware projects.

Atari Paddle Controllers $5

Mindscape Power Player Joystick $5
Notes:
Personal favorite.

Epyx 500XJ Joystick $5

(2) New Joystick Cables $5 (For both)
Notes:
For fixing old joysticks or for other projects.

Samsung Composite Green Monitor $25
Includes:
Home-made monitor cable with multiple outputs (for hooking
up to your stereo...)
Notes:
Great for 80-column displays like Kermit65. No speaker.
(Simple enough to hack one in there...)

Antic Sampling Processor $10
Notes:
From Antic February 1990. In a case.

Cheap-Talk Voice Synthesizer $25
Includes:
CTS256-AL2 companion chip to voice synthesizer for furhter
enhancement.
Notes:
From Analog magazine. No case.

Pokey Chip $2
Notes:
For Gumby upgrade.

Disk Notcher $1
Notes:
Very nice. For those of you with single-sided drives ...

From: bruck@BRACHOT.JCT.AC.IL
Message-ID: <9206151330.AA06536@brachot.jct.ac.il>
Source record: 110869

Hi all,
I have a nice little program called Paperweight by Curt Cox.
I copied it from an April 1986 Analog, and it's a really funny april fool
demo. What does it (claim to) do? It's supPOSED to destroy your computer!
The accompanying docs rave about some SDV (Self Destruct Vector) which
doesn't exist, talk about the "hellishly complex" calling procedure,
and what it does.
The actual program, well.... You have to see it to believe it!
It's really cool, and you can have a lot of fun with it.
I'll upload it to umich (please feedback on whether it works) and should be
called paperwgt.obj . I'll send the "docs" (ha! docs..) after someone tells me
it works.

Have a NICE day!!

If you are going to poke around inside a cart, you might want
to check out BASIC/XL. Supposedly, the original floating point
routines in the OS and Atari BASIC are just awful and BASIC/XL
uses entirely new routines for a significant speed increase (I don't
think it uses the OS floating point stuff at all).

You don't need an adaptor cable to use the BB on an XE! The BB has it's own cartridge port so you just plug it into the cartridge port of the XE (the BB's cartridge port is covered up by the cable when it is used on an XL).

Yes, I think there is a demo after the Worm_Demo. Simply press
SHIFT and wait until the worm reaches the left side of the
screen. The last demo on the disk will explicitely announce
the end of the disk.
BTW: Did you see the dancing girl?

```

Notes, The Routine uses Evaluation of Taylor Series to 11th Term for Sin
but since X := X/90 and not The True Radian Value, you must re-evaluate
the coefficient for the term, must figure in the (pi/2)^N for each term
instead of merely 1/N!, the Coeffient thus becomes [(Pi/2)^N]/N!.
Any question on the routine, feel free to ask. It is quite simple.

I am new to using the Atari 800 (I got it cheap, what can I say?). I have a disk for the terminal emulation program "Backtalk". When I load up the documentation disk for this program I find the text is filled with gross misspellings. I didn't know what to make of this until I recently loaded up the documentation and no misspellings were evident... I found that I had left a Telelink cartridge in the 800 as I booted in the Backtalk, and this seemed to have corrected the spelling errors! This seems very odd. The actual Backtalk program also boots up with misspellings. I am not sure if the program works, or whether it is compatible with the 800?

Message-ID: <"92-06-15-20:37:07.40*UJ1G"@DKAUNI2.BITNET>
Source record: 110879

Jeff,

I didn't know the name "Maclaurin Series", but thanks to Craig we now
know what we talk about.
Anyways, over the weekend I've experimented with the series using my
Calc books and my HP calculator. Our well known series for SIN

x^3 x^5 x^7 x^9
SIN(x)=x- --- + --- - --- + --- would yield a reasonable accuracy
3! 5! 7! 9!

only very close to x=0. The approximation will be worse if you go
further away from this value. The 'upper and lower level' would be
plus minus pi/2 (equivalent to +-90 degree). This series requires
radians to be put in as 'x'. Use the formula posted by Craig to
recalculate it into degrees.
Since the values beyond pi/2 are getting very inaccurate you have
two choices:
x^15
1. go on with the extension up to ---- to get an
15!
accuracy to 8 decimal places in the whole range from
0 to 2*pi (that's what my "Bronstein" Calc book says)

2. Calculate the Taylor Series extension around the desired
value. I've done it for the value "pi" (180 degrees) so
the following series would yield accurate values around this
point.

(x-pi)^3 (x-pi)^5 (x-pi)^7 (x-pi)^9
SIN(x)=-(x-pi)+ -------- - -------- + -------- - --------
3! 5! 7! 9!

I think this kind of approximation would be very fast in Assembler.

Yes, I know. A look up table is always the fastest way for any kind
of tricky calculations but these Taylor Series are very fascinating.
You can expand almost every complicated function into a Taylor Series
being as simple as this one above.

Source record: 110880

The SIO port is a part of my favorite computer (130XE) :-) I really know nothing about. Does somebody know how it works?
What happens when the computer wants to get data from the drive D1: ? What is the protocol for this operation? Which pin of the connector goes to lo or hi? What are the communication patterns when the devices talk to each other on the serial bus? How does it look like when the printer 'tells' the computer:"I'm here" ?

I know that the low level communication happens through a hardware address called something similar to SERIN or SEROUT. But how does it work on this and on the even lower hardware level?

2334. My 800XL ISN'T Really Dead

Newsgroup: comp.sys.atari.8bit
Date: 1992-06-16 13:41:49 UTC
From: tmkk@uiuc.edu
Message-ID: <Bpxy1p.uI@news.cso.uiuc.edu>
Source record: 110882

For those of you who have been following my problems with my 800XL, hanging on the edges of your seats waiting for news, here's an update:

The 800XL isn't dead after all, at least not completely.

As was suggested many times, I checked the power supply with a multimeter. All the proper pins had the proper +5VDC, so my initial assumption that the PS was good turned out to be correct.

Next, I tried another poster's suggestion, and took the motherboard out of its case and shield, hooked it up, and began checking for abnormally hot chips.

While I was poking around, I hooked it up to the monitor and discovered the computer was working again! Apparently there is some sort of loose connection on the motherboard. For some reason, the computer doesn't quite fit properly into its case; to plug in the composite monitor cable, you have to push down the motherboard by sticking your finger through the cartridge slot. This causes the DIN jack on the back to align properly with the hole and allows the plug to be inserted. Apparently this also flexes the motherboard, causing an intermittent connection *somewhere*.

As an experiment, I tried using the RF output, leaving the composite connector unplugged. It continues to work, but occasionally the computer will "freak out" and whatever program I'm running will instantly shatter into a cacophony of buzzes, beeps, and flashing colors. Power cycling usually does the trick, but it's irritating to be 3/4 of the way through a level in Shamus and have the machine lose it. Obviously, a complete game of Heracles is out of the question! ;-)

So, it sort-of works, but it's effectively unusable since there's no way to predict when or if it will have a seizure. Since I can get a replacement machine for 1/4 the cost of having this one repaired, I'm working on acquiring a backup system or two.

Don't know, but it probably wouldn't be too hard to trace through
and find it (assuming that the OSS bank switching doesn't get in
the way). My info about the FP speed increase came from Bill
Wilkinsons's COMPUTE! column from oh so long ago. He claimed that
the FP routines in the OS were pretty bad, and unfortunately
BASIC relied on them heavily. They were entirely rewritten for
BASIC/XL. The FP<-->integer routine (used CONSTANTLY in Atari
BASIC) was supposedly sped up by a ridiculous amount (ten
times?).

>Anybody remember this game, the sequel to Action Quest and Ghost
>Encounters? Anybody still HAVE it?

Yes! Last fall I finally built the SIO2PC interface and started digging
up all those old games that I hadn't played for years. Now they're
all on my PC's hard drive, arranged in quick easy menus, and I can
load them up instantly whenever the urge strikes. :)

Journey to the Planets was fun; it always cracked me up how that
cloud would just spontaneously appear while you were blasting off.
Compared to modern games (like Sierra's adventures, with music and 256-color
graphics and animation), the silence in JTTP is a little haunting.

>`Basic'

Being an old Atari 800XL user, I must of course point out that the Atari 800XL had the same capability. (Ah, the rivalry between the old Ataris and Commodores...) Furthermore, one could switch out the Operating System itself, making all sorts of neat things possible. ObHack: writing a program to copy the O.S. into RAM, change the NMI vector addresses that were now in RAM, and run the new O.S. With my "hook" into the O.S. I did such things as clearing the hardware collision registers for the onscreen sprites, thereby making several "impossible" games trivially easy to complete.

Using the same trick, I also wrote a program to dump all memory to disk when a "hotkey" was pressed, preceded by a small header that would load in the memory image and begin execution at precisely when the dump was taken. It worked for small generic programs, but for other programs, it failed because of the unfortunate phenomenon of "write-only" hardware registers; once a value was written to a register, there was no way to determine what that value was, and hence, no way for me to save it to disk. :-(

Hmm.. my 1200xl does this almost EVERY time I power up. All I do is hit
[RESET].. It usually finishes powering up after the first hit. If not,
I just hit it ([RESET], that is! no my 1200xl!!) again until it does.
Pain in the butt, but what else can I do!?

All this talk about SnapShot has given me the question about upgraded
8-bit systems. For example, could SnapShot handle copying a 256k
upgraded system? Or a 320k? or a 4meg for that matter!? Then again,
how many >64k programs would somebody be using at one time!?! :)
Also, can Snapshot work w/o a h-d or mio?? Maybe I'll get a 256k
upgrade and just have it copy the memory into the RAM disk. Ugh.
Another question!!... what about TurboBASIC and other "under the OS"
programs? Do they work ok? (BTW: I sector-edited TBXL and made it look
a little nicer... "READY" is now "Ready" etc.etc. It was fun.
Unfortunately, I forgot to save the latest version of my sector-editor.
It was pretty cool, too! <sob>) Anyways, I sent for Snapshot and
I'll probably (hopefully) learn all this stuf from whatever .doc files
thar be in the arc.
thanx Bill

I was looking in an old Antic this morning (the power was cut so they could rid the neighborhood of trees) and I noticed MyDOS mentioned in an ad. for the ATR8000! This was a 1984 issue of Antic! I was pretty amazed. How long has MyDOS been around!? What could it do back then? (other than multiple densities)... I suppose if they (Woodmark, right?) upgraded it a version every year, it would be about right (1984=v.1, 1988=v.4.x ?? maybe 1984=v.0? .. who cares about that!) What one learns on a black-outted day.

I'm really confused about that question, Steve (the one about the sprinkler system, etc). But this MIGHT be what you're looking for...? You want the system to reboot, right? If so, you can do this simple call:

```
? USR(58487)
```

or... this is also nice:

```
POKE 580,1:? USR(58484)
```

The first one reboots the system by calling the coldstart routine. The second one sets the coldstart flag to one, so whenever the [RESET] button is pressed, the system will reboot. And guess what that second call does!? It acts like the [RESET] button is being pressed!! I hope that's what you needed. If not, I hope it helped SOMEBODY! :)

James,

Hmmm, really? Do you have that article Handy? Heh heh. :)
Yeah, it sure would be nice to see those rewritten routines, the Action
FP library is unfortunately nothing but a bunch of calls into the OS
Floating Point package.

And, of course, the obligatory Apple II followup: the 16K RAM card that you
could get for your 48K Apple II went in the area of memory where the monitor
ROM and BASIC lived (in fact, that's how you got Applesoft if you had Integer
BASIC in ROM). The fun thing to do was change the reset vectors around, then
drop some pins low so nobody could change the state of the card... Instant
NMI board wired to your Reset key.

I wish I did, but unfortunately my collection of COMPUTEs was
tossed out last time I moved (SOMETHING had to go). I'm not
sure the article was that informative anyway--Bill may have just
have made a few passing remarks--somehow I ended up with these
facts in my head. Does anyone have any old advertising brochures
from OSS? Somewhere I saw some timing comparisons of the FP
routines in Atari BASIC and BASIC/XL, it may have been the
COMPUTE column. Yes, I'm confused...

Oh, and remember that the Newell Fastchip performed its
magic by replacing the FP routines in the OS with something
faster. I'm sure it would be easy to disassemble those
routines, since they need to be at the same addresses as
the standard ones. Mr. Newell used to be a member of the
users group I was in years ago, but I haven't seen him
since then. (For the record, so was Norm Draper of Draper
Pascal fame.)

James,

Hmm, yes, I have the fastchip FP routines as part of my Omniview 256 and
Omnimon XL Operating Systems. I am wondering if perhaps the routines
physically moved though. The two OS chips use an 800 O.S. whereas
I am using (obviously) the 800XL OS and I don't know anything about
which routines were moved, etc.
Wess Newell is still around, he still runs Newell industries.
His latest 8 bit product was the 1088K upgrade for 800XL/1200XL/130XE.
I think he just did some sort of TOS card for the ST machines, similar
to the TEC card. Well, that all unrelated ST stuff.

>but now the simulator doesn't work at all on the new drive. the indus is
>trashed so i can't use it. does anyone know a fix or had this problem?

As I remember it, the disk version of Flight Simulator II used a novel protection scheme which relied on the speed (RPM) of the disk. By modifying the code it is possible to make the game work on disk drives which operate at different speeds. A friend of mine did this about 6 years ago, but I have since lost touch with him. Alternately you could use a program such as Chipmunk which removes the copy protection from disks. If the protection is removed, it should work on any drive. Perhaps someone on the net has Chipmunk and would offer to do this for you, if Chipmunk can even perform such a task. I don't recall which drives the program worked with, but I believe my friend who had to modify the program was using a Rana 1000.
Finally, it might be possible to acquire the cartridge version of FSII, which was released a couple years ago. This would eliminate the need to worry about the disk drive at all, except for scenery disks, which I doubt used any copy protection.

Source record: 110898

OK PHbill...snsht30d uses 65536 byte files and you can copy 10
of these to a HD or 1 meg MIO or 4 of them in 256K RD...would mean
a 320xe to get that although you don't have to run all 10..maybe
just 3...the advantage of the program is each file stays frozen
in the position you left it when you're using a HD or MIO you
don't turn off; then you don't have to load anything, just hit
sh^2, sh^3 etc. to get your porgram. My MIO changes between them
in 2 sec.
You can't use Turbobasic with any of the snapshot programs cuz
they only run on sparta3.2d (as far as I know) and TB uses the
same memory location as SP32d.
Snpshot15m can be used with a stock xe cuz it only saves one
snapshot by hiting sh^- or the HELP key.

I am not up to speed on the workings of the Atari 800XL, so I would appreciate someone heppin me wit dis problem I'm workin on.

The Problem:

I would like to use my puter to measure rpm's of a rotating shaft.

I have all the necessary sensors etc. rigged and I want to use the Atari's joyport to read a series of pulses corresponding to the cycling of the shaft rpm in question.

Question:

How do I make my Atari do this? I know it is capable (with some coaxing anyway).

The shaft rpm will be a max of 32000 rpm. Will the Atari be able to keep up?

I appreciate any help.

Thanks Guys/Gals,
Tim Southern

Hi,
A poster said that many hardware registers are not readable, making them
unsaveable to disk. How can Snapshot work, in those cases where hardware
registers are important??
Also, is Snapshot bulletproof? I'm SURE that many games will be incompatible
with it, and simply make the Shift-^no. not work!!
Any VBI or similar interrupt could disable whatever system Snapshot uses!

Have a NICE day!!

You might have a "cold" solder joint around the video modulator section. Try a low-temp soldering iron. Look for solder joints that look round, first. These are the most likely suspects, in my experience. But don't rule out normal looking connections, either.

Could be any of the above. Try your disk in another drive. If it works
then you may want to find someone that can test your drive for alignment.

To the guy who had that sprinkler program:
Get a Rana 1000 !! Mine gets booted immediately with the computer.
This means that when power comes back, the computer will manage to boot your
disk. The disk drive manages to initialize in the short init the Atari has.
This is true for both the 800 and the 1200xl, which I have.
(the 1200xl initializes slower than the 800)
I also have a Indus GT, which initializes slowly, so the computer will NOT
boot with it if power comes on to all parts at once.

Source record: 110814

I have a request, I need the # and address for Atari, Inc.

What I have are some old Atari Dos 3.3 diskettes that I
need to be translated to IBM Dos format. I am hoping
that they can tell me things about:

sector size
fat table location
fat table format
directory formats
etc.

I wrote my disketts both on Atari 1050 1.5 Density drive and
a Indus GT DD drive, so I need info on how I can read
the diskettes.

I have tried the Atario and Util programs, neither work...

Thanks

Did you uudecode it? I use it with Mydos, and it should load with no problems.
Error 181 means "not a binary file" in Mydos.

Is your SX212 connected through the 850, or through the 13-pin serial bus?
SX Express was made for the latter; you should use 850 Express if the modem
is connected to the 850. When you say SX Express doesn't work, do you at
least get a menu, or does the disk fail to load at all? (Wondering if maybe
Atari put SX Express on an enhanced density disk, which the 810 drive can't
read.) I doubt Telelink will work. Backtalk might, if it has a handler file
for the SX212 or the R-Verter. Bobterm definitely will work.

In a previous article, JJMCWILL@MTUS5.BITNET (Jeff McWilliams) says:
>EasyTech has a 512Kx8 Pseudo Static RAM in their new catalog for $36.00

Sounds too good to be true, with this, I can get on with my simple 1 Meg
UpGrade, or start messing around with designing one hell of a pbi_coprocessor.
Weird thing is, I was just looking at the schematics I made for my .1 - 1 GIG
Easy-To-Do SRAM upgrade a little over an hour ago. This would be simple to
install, and have many routes to pick from.
Can either install another PIA and use that and a slightly modified RamDisk
driver, or merely wire up PIA_PortB on a 800 XL to this. Only bonus on useing
another PIA is that one can have 16 Address Control Lines each swapping in
16K chunks, thats an amazeing 1 GIG of Memory! On top of the Extended RAM
possible on the computer.

-Yes, I'm planning on going to 1 GIG when I have the money. :)

To: umn-cs!exuhag@exu.ericsson.se(James Hague)
Thanks, I can get old Anolog issues at my meeting. I dont have any.
I have alot of those analog games myself(like the ones you menchoned) but
I dont know how they can make them so small. This is just a theory but could
they have compressed the code and have the program de-compress it after
loading? I think at least one game I have does that(not an anolog one).
Im nearly done with my P/M editor now and its great. It supports
animation, allows GPRIOR settings, and writes data to Action format. I dont
want to release it to the public yet(not until I put it to use in making
images for my own game(s)) but if you want a copy for yourself, I might get
you one.
As for game programming, im discovering a big problem with moving p/m
images in mainline processing(not in a interupt) using VCOUNT for timing. It
appearently isnt re-drawing/ moving images on the same TV frame. I tried
everything to fix it too. It may have to do with the DMA antic performs or
there just isnt anuf time.

well thanks again. bye

Some one menchoned something about the disk controller not being so great. this message is to that person.

Interesting that you brought that up cause the disk controller is the main reason I want to get one of these drives. There said to have the ability to work with standard IBM drives. If this really is the case, then I wouldnt mind taking the chance that the disk controller could last a good two years. is it that they overheat? If so, I suppose that maybe something like a heat sink attached to the board could solve the problem.

Nope, no compression at all. It's just that 6502 assembly is
amazingly compact. If you look at the assembly listings for
ANALOG's games, almost without exception they are coded for
size instead of speed, i.e no loop unrolling or huge table
lookups, etc. Speed was just never a problem, even for things
like Tom Hudson's Livewire! so why not cut down on typing time
and make things easier to understand?

> Im nearly done with my P/M editor now and its great. It supports

Sounds great. Unfortunately, my 8-bit game programming days are
"over" (until the frustration of MS-DOS gets to be overwhelming).
Be sure and keep the net up to date on your editor and any games
you write--I bet lots of people would be interested.

Hmmm...I never tried to use VCOUNT. I always redrew everything
during the vertical blank, just to keep the images clean, so
I've never had yor problem. Anyone?

Good luck.

Hello,
I recently read several PC postings and such and came across people
mentioning old titles, of course the titles were MULE, ALI BABA and etc..
This made me come down to a conclusion, is ATARI 8 Bit machines the
best ever built for its time? Personally I think so, and I went through
most of them except the XE series and the 1200, 1400, 1450D. That
those 1450D ever make it to the market? I remember saving up money for
that BEAST, but never saw it.

ATARI 8BIT FOREVER

Tony Lang,

One Gig eh? Hmmm.. like to see you load up that ramdisk until its
chock full. you'd need a HUGE hard drive just to load the thing up.
Heh heh. I've been thinking of uses for the Dual PIA/QUAD PIA upgrade
myself, but I am not sure using one of its ports for BANK control
is the best thing to do with it. Well, it would be great with
Sparta 3.2d and any other DOS, except SpartaX. I really like that DOS,
but so far no-one has broken the mysterious DRIVER.SYS code so that
drivers for things like your 1 gigabyte RAMDISK can be written.
Dang it all.

What I think a Pseudo SRAM is, is DRAM with builtin refresh circuitry
that is wired so that it just looks like SRAM on the pinouts.
Jeff Potter mentioned the PSRAMs may be real power hogs.
Still looking for data...

Jeff McWilliams

Lets check

Shaft: 1/32000 = 0.0000312s which means 31.2 microsecs
Atari: 1/1Mhz = 0.0000010s which means 1 microsec (*)

So if I didn't type anything wrong on my caclulator you should have around
32 cycles (~11 instructions) per rotation.
If you need more time how about using a digital counter to divide the
frequency by 8 for example. You wouldn't lose much precision.

To read the joystick port:

PORTA = $D300 ; gives joystick 0 and 1

lda porta ; reads port
and #$01 ; gets you just the UP direction of joystick 0

Nat!

Yo! I have tried (and succeeded (non-bashful mode (har))) to come up with a cross development system. It's called nasm65 and it's available on atari.archive.umich.edu in the atari/languages directory. The binaries are for the ST, but the sources, last time I checked compiled and worked fine on a PC.

For transfer between the ST and the 8-bit there's also NASTY, (that's a little hardware project though) in atari/8bit.

>report back on the response.

I'm for the formation of the rec.games.video.classic group
which someone suggested a while back. This could include
discussion of the systems mentioned above, plus the ColecoVision,
Intellivision, Channel F, Odyssey, Astrocade, etc.; and games on
older home computers like the Apple II, Atari 8-bits, C-64,
etc. Possibly, old coin-ops could be included in the charter
as well. Basically, everything from the pre-Nintendo
era is fair game.

>Anybody remember this game, the sequel to Action Quest and Ghost
>Encounters? Anybody still HAVE it?

I believe I inherited a (-ahem-) "non-original" copy of this game on one
of many disks I've accumulated that were "thrown in with" systems I bought.
I know it's around here somewhere.

This whole series was grotesquely slow-moving, as I recall -- they had a
hell of a nerve, putting the word "Action" in the title of the first one;
should've been "Snooze Quest" -- but cute and appealing.

Among other things, I'd love to see/read some instructions for the damn things.
And for a couple hundred other games in a similar state...

I've tried it under Windows 3.0, and it does work. Windows in standard mode works a little better, but 386 enhanced mode works too. You have to be a little careful about the .pif settings that you use, otherwise the timing gets screwed up too much. The performance is worse in 386 mode - you can notice when windows is giving processor time to another program. I tried it with Mydos, which seems to be more forgiving of timing problems than atari dos. If you want the .pif settings that I used, I can email them to you. (I don't have Win 3.1, but would expect better or at least the same performance as Win 3.0).

2384. Colecovision/Atari system for sale

Newsgroup: comp.sys.atari.8bit
Date: 1992-06-20 20:45:32 UTC
From: hgm@unity.ncsu.edu
Message-ID: <1992Jun20.204532.28996@ncsu.edu>
Source record: 110831
Cross-posted to: rec.games.video,comp.sys.atari.8bit,triangle.forsale

I've decided that a Lynx, Genesis and two Amigas is enough. It's time to retire the Colecovision/Atari 2600 stuff.

Code:
(X) means no box or instructions
(I) means instructions

Everything else has a box and instructions. In the case of the atari games, the boxes are in like new condition. Note also that the atari games, for the most part, are newer titles with surprisingly good graphics (Solaris is pretty amazing).

Hardware:

Colecovision with original controllers (X)
2 Super Action controllers (very decent joysticks)
Expansion Module #1 (Atari 2600 adaptor) (X)

Software:

Colecovision

Donkey Kong Junior (X)
Cosmic Avenger (X)
Super Action Baseball (I)
Centipede (X)

Atari 2600

Bezerk (X)
Ms. Pacman (X)
Super Football
Dark Chambers
BMX - Air Master
Gravitar
Jungle Hunt
Secret Quest
Defender II
Moon Patrol
Jr. Pacman
Radar Lock
Solaris
Midnight Magic
Double Dunk
Phoenix

I've seen a price of $6.00 (shipping included) quoted for the atari games.
If you take the 14 atari games here that come with boxes & instructions, and
multiply that by $6.00, you come up with $84.00.

I'm asking $80.00 (shipping included) for everything, but I will consider
offers. I realise that this is not exactly state-of-the-art stuff, but that
doesn't mean that the games aren't fun to play!

It's a game put out a long time ago by Electronic Arts during its early golden years. It involved you and 3 other players in an attempt to colonize a single planet. The player whose combined plots are most successful is the winner. But at the same time, you can't be TOO cutthroat, because if you undermine you're opponents too much the whole colony attempt fails, and EVERYBODY loses. If you're successful, the most productive player is named "First Founder". A neat game.

Well.. I SUPPOSE if you were to hook up 2 paddles to it SOMEHOW you
could get some LSB/MSB working to give you accuracy from 0 to 52440..?
(229*229 - the paddle's accuracy.. btw: WHY!? why not 256???) Anyways,
I'm not totally sure, but from playing with the Parrot, I've learned that
the thing could do waves... and also the way the trakball works (by
digitally counting analog sizes (in that case the distance (or speed) the
ball is rolling (was this how the old Indy 500 controllers worked??)) I think it
should be possible.
Somebody out there will know better than me! :) just bein' hepfuw

It could be the latter. I work with sprites ever-so-often in BASIC. I
don't have too much trouble unless I'm moving REALLY big sprites. In
THIS case, you MIGHT want to spare the 1k to have another PM Base and
moving the Player in THAT base, and then switch the base pointer (54279)
to the new one RIGHT as you change the x-position. The closer you do
these two things, the better! I've tried using flipping whenever I can
(mainly using graphics, as I almost never use sprites anymore.. maybe
your editor might come in handy! :)) Anyways... good luck. Good to
see some new game-makers out there! :)

Replies: 0

Well, Snapshot wasn't designed with
games in mind. It is a productivity
enhancement, not a game enhancement.
(Tho Snapshot 1.1, used with the
SOFTBOOT utility, and handle lots of
boot games).
When it comes to applications, not
many of them use the hardware
registers as intensely as games do.
Even at that, often the hardware
registers are updated every frame, so
they will be reset every 60th of a
second anyway.

About vector stealing- Some
programmers will steal a vector, with
no attempt made to save the address
originally found there, and JMP to it
in their own routines. That's where
the REHACK.COM utility comes in
handy. For such applications,
REHACK.COM will become a watchdog,
and allow these applications to share
the interrupt vector with Snapshot.
Instead of stealing the vector, they
should use the same technique used
with the DOSINI vector, which allows
several routines to hook into it.
This same technique can be used with

the interrupt vectors as well.

As far as a conflict
with the Snapshot hotkeys goes, the
worst conflict that I'm aware of is
with Bobterm and Snapshot 3.0c and d.
They use shift-control-#'s. There is
a utility that will change these
versions of Snapshot's hotkeys to any
keypresses you'd like. Or, you could
switch to another version of
Snapshot, which uses different hot
keys. Or, you could just avoid using
the shift-control-# macros in
Bobterm, and stick to the control-#
ones?

Jeff, I'm having trouble posting to C.S.A.8, I was wondering if you could
post this for me?
;;;;;;;;;
As suggested by Jeff McWilliams through E-Mail, I should ask the readers of
C.S.A.8 this question, so here it is:

I'm planning some shareware projects over the summer, and one of them
includes a (very fast) 80 column display editor (i.e. full blown editing
capabilities). However, before I attempt such a project, am I really
wasting my time putting effort into it? So, I would like to hear feedback
(preferably through E-Mail) from you 8-bitters (out there) that want & would
actually *pay* for such software. If I get enough responds, I will go ahead
and write this handler. (My initial testing of a demo version I had put
together, proves it to be very fast, so you need not ask.)

Also, I should mention that I will probably be including a couple other
programs into this package (i.e. Term program, Font editing, a Text
previewer, etc.)

In your replies, I would (at least) like to know the following:

1. What type of 8-bit & DOS you're using?
2. What (reasonable) price should Dave ask for?
3. What uses do you see for this 80 column display handler? (Optional)
4. Would you pay a few dollars more if Dave included programs that would
```

take advantage of this 80 column handler? (Optional)

From a soon to be 8-bit Shareware Author...

-Dave

To whomever decided 32000 rpm is 31.25 microseconds per revolution,
remember rpm means revolutions per minute, not second. That means

32000 rev/minute = 533.333 rev/second = 1.875 milliseconds/rev

which is much easier to count on your Atari!

Body handling: HTML body converted to readable text

The best thing to do is assume Atari will not help . There's a number of utilities to convert DOS 3 to DOS 2 format. The utilities are on the DOS 2.5 distribution disk & are OK'd to be distributed free . If your system is not set up anymore, see if you can find a local user to do the conversion.

2397. Xf551 problem, and question...

Source record: 110845

I have a Xf551, in which I put a new mechanism...(the original does not work) and I can get the new mechanism to Read and write perfectly, but it will not Format a Disk! it either gives error 139 or 140. I have another mechanism, which does the same thing, it will NOT format. Has anyone had the same problem before? Is this the mechanism, or the controller on the xf551? Is there anything I have to set on the mechanism in order for it to format correctly?

Also, what may help me is, what does Formatting do, other than writing Null characters on the disk and setting up the directory and sectors?

Someone here mentioned that Percom floppy controllers have a short lifetime. I have been using 2 Percom SSDD floppy drives on my 8-bit for about 9 or 10 years, and the controller in the first drive (non-first-drives are slave drives with these Percoms) is still going strong. I have had an overheating problem in the past; this showed up when a s/w package I bought had a bad floppy (that is, from a bad 'batch' - the copy protection was hosed) and I tried booting it over and over, many times, to get it to run. After about 30 or 40 minutes of this, my (first == boot) drive started spewing garbage data. (I could tell from the sound, you know?) So, I turned everything off and let it cool down awhile, and later the drive was O.K. when I tried a known good bootable disk with it. After this, I went out and got a little tabletop fan, and set it up behind the floppy drives. I've never had an overheating problem since. These Percom drives are almost "bulletproof" in my experience.

Source record: 110847

Hmm, interesting problem with your XF551. You are not trying to format the back side of your diskettes, thus generating this error are you? The XF551 looks for that timing hole in the disk, and won't format the disk if it is missing.

My stock XF551 has been acting a little finicky itself lately, wouldn't format a disk that my Happy 1050 drive formatted just fine. Of course, we used to joke that a Happy 1050 could pull data off of a paper plate if you asked it nicely... :)

Bob Puff mentions in his add for his XF551 enhancement upgrades, that his upgrades fix some bugs in the controller ROM in the stock XF551.
Perhaps he knows something about this, I recall Bob Woolley said the original ROM had a bug that didn't wait for the disk to spin up to speed properly before issueing a READ/WRITE command. Perhaps there are other bugs lurking in there.

2401. "New" 8 bit user questions

Newsgroup: comp.sys.atari.8bit
Date: 1992-06-23 16:58:52 UTC
From: dylan@cs.washington.edu
Message-ID: <1992Jun23.165852.24418@beaver.cs.washington.edu>
Source record: 110849

I just dug out my old 800, thanks to a friend that gave me his old
Indus GT drive (my Percom died about 8 years ago.) I've had a blast
playing with it, and now consider myself a "new" user again. So,
I've got a few questions:

1) Are there any places that regularly have "clearance" type software?
I ask because I bailed out of the 8-bit market pretty early on,
so I missed out on some classics, like all the Lucasfilm games, etc.
Even when I was actively using it, I wasn't totally up to date, so
I never got MULE, which I hear I should have. I probably only have
a fraction of the "classics".

2) If I wanted to play around with "high performance" programming,
would I still be well-served by the ValForth package I bought in
1981? If so, is there a more recent version? If not, what are
the alternatives?

3) Are there any PD sites for these guys? I guess I'd need to start
by getting a terminal program...but I face the bootstrap problem--
how can I get software onto the beast without having any communications
software to start with?

thanks--

Source record: 110851

To the fellow trying to do fast digital I/O through the joystick port:

I tried a while ago to make a "high speed" communication link from my PC to the atari through the joystick port. (This was before I found SIO2PC). I could never get it to go very fast which was puzzling because both computers were quite capable speeds greater than I was able to achieve. What I found out was that the joystick I/O port pins are low pass filtered. If you remove the cover and look at the board you will see what looks like a bunch of resistors in series with the I/O pins. They are in fact inductors which limit the transisition times of signals. (Somebody want to back me up on this, I'm only 90% sure)

Sorry I don't remember how fast I was able to send data but I'm sure it was no where near 32Khz. The 533Hz (1/32000 RPM) is probably closer to what is possible. I really don't think it is a whole lott faster than that.

You could certainly cut out those inductors. I almost did but then I found SIO2PC and dropped the whole thing.

2406. Re: Percom's drive controller

Newsgroup: comp.sys.atari.8bit
Date: 1992-06-23 22:54:51 UTC
From: deaven@physics
Message-ID: <128a3rINNa7e@agate.berkeley.edu>
Source record: 110854

I'll add my two cents worth: I've had a Percom main drive and slave drive unit for 10 years. Although the apron on the back of the main drive gets hot enough to fry an egg, the thing has never had an operational problem. I used to use a fan (actually, a homemade duct that hung out the window with a fan on the end--it was quiet) to cool the sucker but after a few moves I just let the thing burn.

I'd like to know why the heck the power supply dissapates so much energy; I think continuous operation might be a hassle because the _air temperature_ inside the case gets so high, diskettes are subjected to ambient temperatures past the rated limit. I wouldn't want to run a BBS from a Percom, for example.

I got my drives from an insider who got them before they were released to retail, and I always assumed that they got hot because the power supply was a prototype model or something. Now I want to know: Can I use another more efficient power supply with my drives? I have no documentation, no schematic. Anybody know?

2407. Demos Question

Newsgroup: comp.sys.atari.8bit
Date: 1992-06-24 01:35:59 UTC
From: thester@isis.cs.du.edu
Message-ID: <1992Jun24.013559.11003@mnemosyne.cs.du.edu>
Source record: 110755

Can anyone tell me about these two demos that I just acquired from the archive at umich?
Das_omen.arc
Expo91de.arc
Currently, my 800xl is down with a couple of problems, and I am using my trusty old 400 with 48k. Neither of the programs will work. Do they require the xl/xe series to work?

On another subject, I also have Draper Pascal. When I first booted it, it gave me a message about my memlo setting. It was $1F04 and said the maximum allowed is $1D7C. I am using MYDOS and lowered the number of buffers (files open) as suggested by the Draper Pascal docs and tried again. This time it worked. Following the instructions in the docs, I tried to compile the sample1 program. (kaleidoscope) Nothing doing. Then I couldn't even delete the sample1 program nor copy it because MYDOS has to have at least 3 buffers/files open for this to work!!
Do I switch to another DOS or what?
Any help would be greatly appreciated.

Tim Hester

Source record: 110757

I assume the best thing about Percom drives is that it lets you
connect IBM-PC drives to the serial bus on your Atari.
Has anybody made an attempt to make a homebrew interface working
in a similar way?
I would really like to see a VGA card or an IBM floppy disk
controller connected to either the serial bus or the PBI.

I'm seriously thinking about making the hack sometime, but I
would need some information about IBM connectors and how to
"talk" to them. I've already consulted some IBM hardware books
but there's no information about the connector that is placed
on the IBM drive (called Shugart connector (?)).
Another problem is how to connect something to the PBI that
probably runs at higher speed than 1.79MHz?
I've heard sth about dual ported RAMs. What about these guys?

2412. System reset proof... how??

Newsgroup: comp.sys.atari.8bit
Date: 1992-06-24 12:39:56 UTC
From: bruck@BRACHOT.JCT.AC.IL
Message-ID: <9206241239.AA22881@brachot.jct.ac.il>
Source record: 110760

I'm writing a little (little?????) project (namely, a paint program -- one
of the best!! -- if it comes out..) in assembler (btw I use A65 -- it's
great!!), and I have a problem: I want it to be system-reset proof.
Let's say I have an address called INIT, to which I want it to go,
after Reset, and after the disk initialization (u know... the thbthbth
sound..). It's vital for the disk to init!
Even better:
How can I get it to run a small code to make a little screen that says
"Now initing disk" so people won't think it's crashed,
or, even BETTER..
How can I make the sound not occur? Right now, it doesn't make the
sound -- but disk operations cease to function, since it jumps
straight back to INIT, without doing the DOS part.

Something else:
Where should my program be ORG'ed? Now it's at $2C00, but I'm sure
I could overwrite the DUP (but not the FMS) without crashing..
I'm running out of memory, and a spare byte or so could help!!
Comments on that anyone???

Pppppplease help me!

Shalom from Jerusalem!!! -Itay

2413. WANTED: Atari 5200 Power Supply

Newsgroup: comp.sys.atari.8bit
Date: 1992-06-24 14:12:10 UTC
From: drudetb@infonode.ingr.com
Message-ID: <1992Jun24.141210.7253@infonode.ingr.com>
Source record: 110763
Cross-posted to: misc.forsale,rec.games.video,comp.sys.atari.8bit

I'm looking for the AC power supply for an Atari 5200. This is the
style with two controller ports on the front. Anyone have an extra
working one or know where one can be purchased ? Also, can you substitute
another type of power supply ? (Maybe from an Atari 800 or 400?)

Thanks!

2414. Writing A Disassembler

Newsgroup: comp.sys.atari.8bit
Date: 1992-06-24 14:20:59 UTC
From: tmkk@uiuc.edu
Message-ID: <BqCt71.Auo@news.cso.uiuc.edu>
Source record: 110761

Just for snicks, I'm thinking of writing a disassembler for Atari machine code. Yeah, there are tons of disassemblers out there, and I've even found one with Mac/65 source code included, but I'd like to try it just for the intellectual exercise. What this means is not only do I have to implement it, I have to learn HOW to implement it. Are there any decent books which actually go through the steps of designing and implementing a disassembler? Or is disassembly a sort of "black art" and not really covered by regular programming books?

Also, what is the format for a disk boot record and a binary load file? I know the first few bytes of the first sector on a disk contain information such as # of sectors to load, address at which to load the data from those sectors, a boot continuation vector, etc. Similar information exists for each segment of a binary load file. I know the information probably is printed in half the Atari programming reference books ever put out, but apparently the books I have are all from the other half. ;-) Is there a text file somewhere with this information that someone could email me? Is it on an ftp site somewhere? This information is a pretty basic component if the disassembler is to be able to operate on self-booting disks and binary load files.

Thanks for your help.

2415. Good old games

Newsgroup: comp.sys.atari.8bit

From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <61022@cup.portal.com>
Source record: 110762

Steve; I got joystick/RS232 links to go to 19,200. It probably could go a little faster, but my clone & ST couldn't keep up at 19k anyway. Your right about the inductors & SIO2PC being a MUCH more elegant solution, but the worst problem is the screen/ANTIC. Really interferes with your timing loops. Only way around it is to disable everything while transfers are going on. Bob Puff said he hacked the MPP R: Handler to go 1,200 baud with the screen on, but the rate at which the interupts interfered with the mainline code made it take forever to just redraw a menu.

2417. 810 MPI push button eject drive mechanism

Newsgroup: comp.sys.atari.8bit
Date: 1992-06-24 16:02:48 UTC
From: darkwing@cis.umassd.edu
Message-ID: <1992Jun24.160248.9275@cis.umassd.edu>
Source record: 110764

Hello everyone,

A while back, someone had mentioned to me a company that still had
MPI push button eject drive mechanisms left for cheap....

Well, I can't seem to find where I 'saved' this information.....

I don't rmemeber if the person said Best Electronics, B&C, etc....

If anyone knows where these mechs can be bought and parts for them as well
(pressure pad)... let me know....

Thanks,

-- Curt

p.s. I have a happy 810 with 5.2 software, what is the newest software
release avail for this drive ?

2418. 2600 hack

Newsgroup: comp.sys.atari.8bit
Date: 1992-06-24 18:19:17 UTC
From: bn137@cleveland.Freenet.Edu
Message-ID: <1992Jun24.181917.20786@usenet.ins.cwru.edu>
Source record: 110765

Recently I've found some information about the 2600 game system
which I've also somewhere at home.
It says that it has a CPU called 6507 which is simply a 6502
without IRQ lines and with only 8KB addressing space.
All instructions seem to be the same as our 6502 instructions.

As far as I could see, the documentation provides a full register
description of the system along with all connections of the
cartridges.

I wonder if it would be possible to read out the game cartridges
and copy the code to the 8-bit Atari. Then it should be possible
to change the code in a way allowing to run it on the 8-bit.

Message-ID: <BqD4A4.FM8@news.cso.uiuc.edu>
Source record: 110766

Hi, I have an 800XL with an Indus GT disk drive to sell. What are they going for these days? When I lived in Cleveland a few years back, I remember a number of local computer stores used them for dedicated BBS systems? Anybody need backups?

I am asking $25 for the 800XL plus $50 for the disk drive. I also have: a printer interface, a GE thermal printer, Donkey Kong cartridge and Paperclip wordprocessor (plus Kermit, Deep Blue C, Ballblazer, etc. ...) How about the whole box of stuff for $100? (postage paid)

Respond by email if you are interested to: b-banko@uiuc.edu

No way, no how, no chance. The 2600 is *completely* different
internally from the 8-bit computers. About the only thing
they have in common is that there are 128 total displayable
colors. The 2600 cannot even *display* a single static
screen without the processor plugging away, line by line,
telling the display chip what to do. The display buffer
contains exactly ONE-HALF scan line of information. Player/
missile graphics are completely different as well. Have
I convinced you yet?

>it was no where near 32Khz. The 533Hz (1/32000 RPM) is probably
>closer to what is possible. I really don't think it is a whole lott
>faster than that.
On my 800XL I tried to check how fast I could put out characters using handshaking over the MOTOR and IRQ line (w/o losing chars of course) and I remember that I made about 200 kbps (25Khz)

If this induction thing is true, this is *really* bad news, 'coz reliable communication from a certain speed on would be impossible. Maybe the ALCHEMIST has a definitive word on this ?

Has anyone ever done any serious work with SynCalc or Calc Magic (Antic)?
I am curently using VisiCalc and I like it quite a bit but it can be difficult
to edit your work. I remember using a friends Syncalc a coulple years ago,
but I could not get it repliplicate select fields when copying formulas... It
was all or none. VisiCalc lets you select which cells you want to replicate.
I have never used (or have seen) Calc Magic but I here it is really good.
Has anyone ever used Calc Magic or Syncalc and how are they for scientific
work?

Thanks....

Adam Conover.

Source record: 110773

I have used both Syncalc and Calc Magic for payroll programs
at a public library. Unfortunately, I didn't like the "bells &
whistles" of the calc Magic program It was a cludge moving thru
all those flip down windows.
Syncalc was fine if the people didn't mind if their check was a
penny or two + or -.....what I mean is the value in each of the
cell windows was a rounded off number (something that syncalc
does when you specify 2 place decimals. So I had to write formulae
to consider the REAL value each cell would probably have and make
sure the right values came out on the checks.<- It was a lost cause
cuz my supervisor didn't like me to be even 1cent off!
But I finally found success and accuracy using SpeedCalc...a program
that was in the old Compute! mags and the updates ->it does have
accurate cell displays and you can MOVE or COPY blocks of text with
no problem
You probably can get Speedcalc on one of the BBSs. I don't know
if it is in the umich archive...if not I'll send it.

There should be two screws under the door that yu pop up to put the carts in.
You will probably also find the ram/rom cards to be open boards instead of the
"consumer" version sealed in plastic boxes. Oh, remove the screws and pull the
cover tword yourself and it will open as the one with the "black plastic"
things.

I don't know about the DAS Omen demo, but the Expo91 demo is in compiled Turbo Basic, and definitely does require an XL or XE. As for running Draper Pascal with Mydos, I've heard that someone took the Mydos source code and wrote a customized version of Mydos to get the memlo low enough so Draper Pascal could work. I'm not sure if the custom version of Mydos is on the atari.archive, but it's on GEnie, and I think on Compuserve.

You are looking at a later 800 that is fully expanded to 48k. The
first 800s had what, one 8k card, then you could expand memory by
buying 16k or 8k cards. (Sears still had Atari 16k cards for sale
as late as 1986, some still had an old price on them- what were
they, around $100?)

Someon tell me if I am mistaken, but wasn't the reason that they
had the OS on a plug in card, was if there was a revision, they
could sell the revised OS card and you could just plug it in?
Was the latest revision of the 800 OS revision B?

(It is all too hazy now, and I don't feel like opening my doorstop,
er... Atari 800.)

Just store the initaddress of your program in $0A, $0B and $2E0, $2E1 and
set $244 to a value different from 0 (maybe that it is vice versa, that it
must be zero). Refer to De Re Atari.

Hope that helps.

Just a VERY minor suggestion. We probably should aggree on a standard format for memory mapped I/O. For example, I've got a 6821 wired into the $D700 space, but it takes the entire page as it's own. IMHO: We ought to do something like say the $D700 address is ours. All hardware in this area should be fully decoded so yu could add more then one device. Something like:
$D700-$D703 PIA for memory expansion.
$D704-$D70F room for 3 more PIA's
$D710-$D71F 1-4 6551 UARTs
$D720-$D72F A/D?
$D730-$D73F Bus disk controller?
etcetera so we have the page divided into 16 hardware areas, each 16 bytes wide. I'll have to check my references, but I can't think of many devices that need more then 16 bytes of address to get at their registers. As I think about it, maybe it should only be 8 devices by 32 bytes since there's a quick one of 8 !CS decoder that'd probably work.
BTW: When I was on vacation last week, the hotel I was staying at had their satelite TV with genlock scrolling messages experience a crash. Guess what! the familiar light blue on blue Atari screen! Two 8 story condo complexes with 100's of rooms & a huge ($$$$) satelite system running under the control of an 8-bit. The thing could apparently be programed to select a channel and put a scrolling message at the bottom at preset times.

You weren't talking about the stuff I posted were you? I ended up sending out RLE map files that no one knew how to decode <g>. Ended up sending maps out VIA snail mail to a number of people. Not to whine to much, but I made about 20 copies of maps that I've sent out & not one of the people I've sent them to has EVER jumped in to pass the favor along. This has been over about a 4 year period on a number of BBS's. Anyway, if you have some questions, I doubt if there's much of anything you could stump me with. I probably have about the most complete set of notes/maps/hacks in the free world. I may be a little short on the upper level of the Dungeon, one of my sons 'little worm' friends stole my map.

For those off you who don't subscribe to AIM, I've taken the liberty of typing in the recent issue's editorial article, since the news contained therein effects us 8 bitters as well as other Atari supporters.

We've recently heard that Atari Explorer is about to be moved "in-house". John Jainschigg has shared with us his thoughts against moving out to Sunnyvale (into what some have called "the pressur cooker"). It is his decision to not accompany Explorer to Atari Corp. He will do only one more issue from New York.

As you may remember, John pulled Explorer out of the ashes after middle managers at Atari Corp. "fired" Betsy Staples and David Ahl. John kept improving Explorer, while Start folded, making Explorer the "flagship" of Atari-specific magazines. Explorer is the only other Atari-specific magazine next to AIM on bookstore shelves. Explorer is also the only glossy left in this market.

We feel Atari execs are making a bad decision by moving Explorer to Sunnyvale. It is very possible that Explorer won't last long in the political tug-of-war at Atari. If Explorer ceases publication, it will be a very sad day for all Atarians. It will be taken as a sign that even a glossy magazine supplemented by Atari itself can't make it any longer in the ever-shrinking Atari computer market.

Some may say Explorer's death would help AIM and other magazines. This is not true. Each time an Atari magazine dies, the market convulses; developers decide to move to other platforms; users decide, since they can't find an Atari magazine at a local bookstore anymore, to move to other computers.

We wish both John Jainschigg and Atari Explorer a long and prosperous life.

Bill & Pattie Rayl

As you may or may not recall, Ron Kovacs of Zmagazine recently entered into a cooperative effort with Atari Explorer to produce Atari Explorer Online magazine. (see Zmag207 on the Atari Archive for details.) Is anyone receiving Zmagazine or AEO these days?

James,

Whoops, Firebug was the game I was thinking of. I knew it was something BUG.

To the person inquiring about BART, this is an e-mailer that will send
files from the Atari.archive site.
The e-mail address is as follows:

atari@atari.archive.umich.edu

if you want a listing of files, send them a message with the following:

send 8bit/index

But you will need a uudecoder to decode the files BART sends.
There is a FAQ periodically posted to here that would help answer a lot of
your questions.

In a previous article, Rick_Michael_Cortese@cup.portal.com () says:

>about it, maybe it should only be 8 devices by 32 bytes since there's a quick
>one of 8 !CS decoder that'd probably work.

Most likely, set aside around 32 Bytes for each device. Say, one suggestion
if you haven't done this already - Get ahold of the 1090xl.text file from
the Atari Archive. It goes into quit alot of detail and thinking of what
the box was going to be, it helped me get a vague overview of the pbi
as well as gave me a few ideas here and there.

Also, one further word on the UARTS, there are real 'sweet' ones out there
but cost around $25. Also when implementing the RS232 ports, you need to
drive from TTL logic levels to RS232 levels [+/- 12 V] and most solutions
use some sort of 1488/89 [dx/rx] but they require that you supply BOTH
positive and negative 12 Volts, but a wonderful company called Maxim sells
chips which only require you to supply the normal 5 volts, you hook up
4 capacitors, and it does the dc-dc conversion in the chip and uses less
Mamps than the other chips. Many different version package chips exist,
the Max232 has 2 lines each way and is rated at 19.2 Kbaud, if you need
faster the Max232A can reach above 38.4 Kbaud. This chip comes in a nice
16 pin package, but there are other configurations.

As per UARTs, here is so info I have: Rockwell sells a ACIA with inbuilt
Baud Rate Generator and a 2 Mhz bus speed. If you need a Dual UART, then
go for MC68681a/b or MC2661. And if you want the full kaboodle, then Signetics
sells a 'killer' 68562 DUSCC, dual parts [baudrate & acia ports] with a
4 Deep FIFO stack, with DMA control and full sync/async compatabilities -
this chip is often used on 68xxx based machines as well as some SParcStations.
This is the chip which costs $25. Also National Semiconductor has a 16550
UART, or Zilog has its Z8530, Dual Uart, 4 Mhz bus rate, used in Macs to
achieve 239 KBaud.

I am not sure about how many addresses each require or such.

Oh, BTW: Why not just keep the PIA's at the PIA address of $D4xx ?

Other devices are:

1] Time/Date Clock
2] Speech Synthesizer
3] 80 Column Card

Also, the way I'm planning on doing things is attact an External CPU,
write the Software myself [which would be its OS] burn it in, and let that
puppy deal with the external Hardware myself. Leaves everything wide open,
you can send it instructions on what to do, and wham, it does it. No need

for the main 8bit to even have to know where or how things are wired up.

[sorry, kinda babbled on and on]

Rick,

Hey, defining a standard for the $D700 page sounds great to me. Actually, if I recall, D600-D6FF was also reserved for PBI type stuff and could be similarly used. I plan on doing the QUAD PIA upgrade that addresses the other three PIA chips above the first one, by fully decoding that page of address space.

I've seen a Holiday Inn doing a similar thing with An atari 8 bit across a channel, only it was showing all sorts of announcements and stuff. The SpartaDOS 3.2d TDLINE across the top was unmistakable. I think where I live now, there are doing a similar thing on one of the cable channels.

Jeff

By the way, would it be wise to have one memory location containing an 8 bit latch, where each wired in device could have a bit to register IRQ's? That way, you would only have to check one memory location to see which device in the $D700 page caused the interrupt, instead of polling each device. Just a thought..

Jeff

2443. RS232 homebrew

Who here knows anything about RS232 ports and writing software drivers?
Dallas Semiconductor has a really interesting chip, that is a triple
RS232 Transceiver. It is sorta like a MAX232 with 3 receive and 3 transmit
lines, giving you pretty much a complete RS232 connection. The only other
thing the P:R: connection provides is a carrier detect line, which according
to my Supra Modem docs, defaults to not being used anyhow. So what else would
be needed to say, wire this baby up to a PIA, and then write some software.
Doing the R: handler would be the tough part, something I couldn't do,
but I bet somebody out there might be able to do it. It would provide
a cheap homebrew modem interface for those not lucky enough to get a P:R:
connection or 850 before they all run out, and can't afford a Black Box.

Greg "Maddog" Knauss writes:
>
>How 'bout a software emulator then? Treat the 2600 opcodes as
>an interperted language.

Nice thought, but nope. Take a specific example: the on the
800 you can horizontally position a player by storing the address
in a hardware register. Next frame the player will be in the
right position. On the 2600--and you're not going to believe
this--you have to hit the register right when the scan line
currently being drawn reached the horizontal position you want the
player to start at. Pretty appalling, no? In order to
get a software emulator to work, you'd have to get everything
timed perfectly, right down to the machine cycle level (in
terms of graphics, one cycle equals three or four pixles).
The 6502 in the 800 and 6507 in the 2600 are too close in
speed to pull this off. It would be real tough on a 50 MHz
80486 I think.

Maybe I didn't say things qyite right, but what I need is not hints,
but the posting about 2-4 weeks ago that dealt on the topic.

Its most noteable feature was a long list of potions, and what they did.

It also had a paragraph or two that were written by the author about the
play, and a full description of what the other parts were supposed to be/
what they would have covered.

As for mapping, I prefer to do this myself.

The list/posting also had a list that listed what your stats had to
be to join guilds/etc.

If someone or the person who posted it can do so again, or send it to me,
I would be very grateful.

Joe
P.S. I had this game on my ATARI years ago and loved it. While I
sold the old system, I still wanted this game. I finallymanaged to
get hold of an IBM version. I suppose that it is the same.

-BTW, did they make the Dungeon for IBM?

RE: British Underground
I've got nothing against putting the PIA's in $D400, it's just you'd have to decode the existing PIA so it wouldn't respond to writes to any others in the $D400-$D4FF area. Certainly do able, but off the top of my head (please ignore the hole in the center <g>) it'd be best if you require the existing PIA be removed & placed on W/W board so you could decode the addresses properly. Reason why I said 6551 is 'cause I have a spec sheet & a chip already! The devices you mentioned are superior, but cost $21 more. Tough call what people would rather have: $20 worth of 6551 which would allow them to have a 4 line BBS W/O having to shut off concurent I/O during disk access or a chip that'd run 38k baud. I've also got a 1772 (#?) disk controller that I bought by mistake that'd be a nice addition to the bus, but I think the only way I'm going to get a good spec sheet is to buy the ST developers pack. Arrghhh, but it'll take me forever! At the risk of being percieved as a real prima dona, I don't care what Atari has to say about how expansion should take place. The other 8-bit users are the only ones I'd listen to at this stage. As I BS, I could see an 8 slot card cage on a PC board with an IC to select one of 8 slots & external drivers for the devices. I've got no idea about compatability with Black Box etcetera, but it seems like an idea that's a little over due.

I've got the list of potions somewhere, I'll see if I can find it. As far as I know, the only difference between the 8-bit City & others is the ability to work for a living. I don't think you can use the save/reload to change the potions to a more valuble one in the other versions either. I don't think The Dungeon ever came out for anything other then the 8-bit, but if you have a clone, I'd recomend Bard's Tale & pretend it's the final or continued game. I've recently played BT on my ST & it's almost identical to AR, with the execption of great music.

The reason I say this, is I have seen the Quad PIA Upgrade sheet, and it
merely adds a 1 of 4 or 1 of 8 Decoder and you merely pigback these chips,
with only a few pin downs, the rest pulled out, and such. It is very
simple to do since the Chip has 2 Chip_Select addresses.

True, but the chip, RC65xx51a is the same chip you have, and costs the same
amount. Also, even if you have the 6551 UART, you still need the DRIVER
and RECIEVER chips for it. The Max232 chip has Two Lines per recieve and
send, and only costs around $5. I know, it seems expensive, but when compared
to the $3 for the 1488/89 combo and Voltage Converter it is cheaper and
simpler.
>about how expansion should take place. The other 8-bit users are the only
>ones I'd listen to at this stage.
True, I only listen to what Myself and Other have to say, but please take
a look at the 1090XL doc file. It has a few interesting points in it, at the
end is a full description of the PBI and all its lines and Signals.

Say, how long is the spec sheet for the 6551 UART? I just might be persuaded
to pick one of those up and use that as a simple choice.

Wish there was a Comp.Sys.Atari.8bit.Hardware-Hacking section on usenet.
It'd be alot easier to keep things sorted out.

That would be very wise. I think there is a way that this is implemented
in the pbi/8bit already. I'm not sure off hand, but after I check all my
pbi-related articles and mapping... I'll post for sure.

In a previous article, JJMCWILL@MTUS5.BITNET (Jeff McWilliams) says:

>Who here knows anything about RS232 ports and writing software drivers?
I know about it, and looking into it more and more each day. I know the
theory behind the chips and how each should work, only need to work out
the gritty details.
>Dallas Semiconductor has a really interesting chip, that is a triple
>RS232 Transceiver.
Letts see, Here is another chip, SN75c185 - It has 5 Receivers and
3 Drivers and only takes 1 mA of current. However, I do believe you'de
have to supply +/- 12 Volts for it. Also the Maxim production has MANY
other series of chips with different configuration - I think they have
a 4 recieve and 4 send chip as well.

>be needed to say, wire this baby up to a PIA, and then write some software.
Also, these chips would get hooked up to a UART, not a PIA, a PIA would
never be able to hack it. The Rs232 sends its info serially and not parallel.
Also, in RS232 a Logic 0 is +12 Volts and a Logic 1 is -12 Volts, where
TTL is +5 Volts for logic 1 and logic 0 is less than +2 volts, but the
Driver/Reciever Chips take care of this. Also one more thing that the
UARTS have to do is send the Least Significant Bit first.

Only tricky thing is to use the PBI for anything, you need the Source
on ROM outside the machine---ie access to a eprom burner.

Fill 'Er Up was the only Tom Hudson game I never typed in. I'm still amazed at the stuff that guy wrote. Livewire is still just about the only Tempest clone kicking around. Planetary Defense was great. And the accompanying article for Fire Bug claims that the game was "thrown together in about three weeks." Man! The sleeper of the bunch was Retrofire.

Does anyone remember the commercial games ANALOG put out? Buried Bucks had Tom Hudson written all over it, though I don't know for sure if he wrote it. And Race In Space was later published as a type-in-game. I think there was one other game, but I can't remember it. Did anyone ever buy these? Buried Bucks looked really cool.

Tony,

Okay, I understand a little better now. Up until now, UART's have been
a foreign concept for me. I am sure that eventually sometime this year
a will have an advanced microprocessor interfacing class covering them,
but who wants to wait that long?
I'd like to get ahold of some databooks, but our University Library,
although part of our engineering college, seems to have little in the
way of databooks covering such devices.

Jeff

I've got about 9 pages of docs from a $3 book I bought. I still admit the're better chips out there, but it seems like the easiest chip to work with. The registers/address/control is identical to the 6520, but only uses a 28 pin device. I've got a Max chip too, but I was planning on SIO2PC. I keep changing my mind & get involved in other projects. Blew a full week when a friend of a friend found a bunch of busted up hardware in the Seagate dumpster & a few swap meets. He ended up with a 20 meg drive/controller & 360k drive, girlfriend's mother got a clone with mono monitor, I got a VGA card & Amdek 710 color monitor & no sleep for a week.
Now that I think about it, I see no reason why you couldn't have PIA's at both $D400 & $D700. I haven't really schemed a way to figure configuration with solder though. Ideal would be something like the computer polls/JSR to ROM on the individual cards which then install handlers, but that's beyond my capabilities. I get real confused W/W'ing more then 40 pins <g>. If we agree in general about expansion though, everything should fall into place for a maybe "vapor ware" bus expansion @ $TBD. For instance, let's say Jeff wants a 4 line BBS so he uses his 32 bytes reserved for RS232 for mapping 4-6551's & writes an AUTORUN.SYS file that goes with it. You want a 38k baud link for a laser printer or something, you could then not bother decoding the entire 32 bytes & put in one of the fast serial chips. Hmmmmm... what if somebody wanted a fast serial link & a 4 line BBS on the same computer? Well, I never said it'd be easy! I guess it'd be better to have the software set-up with a configuration file. Sheesh! Who's going to need more then 8 slots anyway! That's enough for 5 serial cards, disk controller, HD, & memory expansion. If you're still need A/D & voice syn while running a 4 line BBS with a laser printer, it's probably time to buy a 2nd computer. Well, I'm just tossing out ideas. Since there's so few of us left, I really feel like we can agree on a general format for $D700. If we get some kind of standard worked out we should be able to design projects that could be relatively easy to adapt to a bus envirionment. Right now it seems we've got as far as bus board with a 1 of 8 card select line & 32 bytes for each card & external software drivers. Still haven't even agreed on how many pins in the slots. It would seem 50 or 62 would be best since there are Apple & IBM prototype cards in that range.

I remember seeing ads for something similar. If I remember right it was
called the "Frog" or something like that. I think they had a version for
the Apple II as well. Anybody else remember this thing? Sure would
like to run across one of those!

Anyone know what the "official" development system for most 2600 games was?

2459. Sec rets of Ali Baba

Newsgroup: comp.sys.atari.8bit
Date: 1992-06-26 16:05:04 UTC
From: tmkk@uiuc.edu
Message-ID: <BqGnCJ.3xM@news.cso.uiuc.edu>
Source record: 110706

I spent a very enjoyable evening yesterday playing Ali Baba again for the first time in years. Even though I purchased the game back in 1982, I still haven't solved all its secrets.

For example, there is a doorway in the ROY G. BIV room which is "impossible" to get to. If you move down the corridor, when you reach the square just before the doorway the game pops you back one square. I "cheated" by adding a bunch of players all in that same room. Eventually it puts a player on the "pushback" square. Once a player occupies it, Ali Baba or whoever can simply waltz right across and go through the door way with no problem. Is there another way to get into that door?

Forgive the haziness of the following description, but it's been quite some time since I stumbled upon this one: there is a room where you can attack an empty space and a door will open in a completely inaccessible area, outside the boundary of the room. I used to think this was some kind of bug, but now I'm wondering: if Ali Baba (say) whacks the correct empty space, and Curufin happens to be in another room at the same time, will Curufin suddenly discover that a door has opened out of nowhere, and will he be able to enter and get to someplace neat?

Anyone remember any other interesting things about Ali Baba?

Actually, what I had in mind was translating, say, sprite calls
on the 2600 into the related P/M calls on the 8-bit (or into the
related software-sprite libarary calls on a 486.) If the 2600
cartridge wanted put a sprite at X, the 800 would just set its
own P/M X position and forget about it -- it wouldn't need to
happen at the same speed. None of the actual 2600 code would be
executing, just like C source code never really executes. Or am
I missing something? (Which is entirely possible. Hardware
makes me itch.)

>these? Buried Bucks looked really cool.

Buried Bucks was Tom Hudson. I talked to him at one of the Glendale
shows and -- this was years ago so it's all a bit fuzzy -- he said
that it started out as a type-in that got a little out of hand.
Simple trick: Changing the shape of the levels in Livewire.
There was a table (Remember when magazines printed the entire
assembly listings?) that held the endpoints for all the sets and
you could go in (to the executable, I didn't have an assembler) and
do anything you wanted to them. I made my own sequel (just with
different sets) called Maelstrom.
More type-in games from the distant past: Battle in the B-Ring.

Hmmm...that's kind of a neat idea. You could write something
which would analyze a 2600 program, carefully counting cycles,
outputting code for the 800.

I don't think this is possible on an 800, though it may be on a 486.
2600 games pull off lots of tricks by messing with registers as a
horizontal scan line is being drawn. You can do this on the 800 as
well I think. Position a player at the left edge of the screen, wait
until the first scan line of the player has been reached, do nothing
for a few cycles to let the player get painted on the screen, then set
a new horizontal position--repeat this a few times and presto, half a
dozen players on a single scan line. During HBLANK you have to set up
for the next scan line of course. This sort of thing requires very
precise timing down to the machine cycle level. The software emulator
would have to keep all of these timings *exactly* the same. Ick.

Heck, just buy a 2600 for $15...

And Bacterion--I loved that game, even though it was a clone
of Rip-Off. It's amazing how much fun you could have with 5K
of machine code...

On a related note, does anyone know what happened to Joel
Gluck, the guy who used to write "Our Game" for ANALOG? He
wrote the infamous Bounce for that column and then one issue
he just disappeared without explanation. Too bad, because
his columns were wonderful. (Go back an re-read them, all
of his observations and complaints are still valid.) Later he
wrote More Fun With Bounce and a little Action! graphics
demo. I'm wondering if anyone has this guy for a college
professor or a next-door neigbor who stays up til 3am hitting
his car with a sledge hammer...

JJMCWILL> might be able to do it.

JJMCWILL> Jeff McWilliams

Puutting the device on the SIO would be more difficult than putting it
on the PBI. Since it must be an "intelligent" device. A PBI device
could be straight forward.

A PBI device does not absolutely have to have a ROM on it. The ROM
allows you to interface to the XL OS. Any program sould write to the
devices registers (bad idea). A little more work would load a driver
and set up HATABs to piont to the routine giving you CIO routines so
that you could use the familiar device interface.

ICD did publich the source to an R handler (in 6502 assembly) in their
PR manual. This would be a good "guide".

If the expansion board does decode into the $D400 and $D700, then it can let the cards decode within that area. This means that each card would only have to decode 8 bits instead of 16. This is a good idea since all cards would have to decode the upper 8 bits anyway.

The problem is what goes where. Yes, you can decide this address if for RS-232, this address is for PIA, etc. This is what the IBM's do. As long as these were I/O devices and the drivers communicated with the CIO routines, this would be useful.

If each slot has it's own address area, then the board need to do no further addressing but a setup program must tell the driver the location of the I/O registers.

A very elegant option would be for sort of software configuration where each expansion card would request a number of registers and the software would tell the card where to decode and inform the driver where to address. That is rather complicated but is done effectively on a few systems (the 8-bits true successor, the Amiga, does this.)

As for slots. US the PC style as they are very available. Also use the same pin definitions (except those signals the 6502 atari does not support). This would make getting parts and proto boards already labeled with the right signals, very easy to get.

Lastly the PC AT slots would give a nice little extension for 16 bit co-processors or accelerators. :-).

Should we even mention alternate bus mastering for DMA or co-processing and the arbitration issues there? >:-).

Good busses are hard to find.

But this is a good project.

Andrew

First off, sorry about the late post... I haven't read this newsgroup in quite a while.

Man I hated that. The buzzing that is. I lived with it for about 3-4 years before someone finally told me the problem.

Here goes. The head is attatched to two rails. It moves back and forth on these rails when it changes track (or whatever). The noise you hear is the vibration of the rails as the stepper motor moves the head a little bit (when the head moves several tracks it does so in several discrete jumps, not one smooth motion).

The way to fix the problem is to open up the 1050 (gentle, now :-). Find the two rails (they're pretty easy to see, two bars of metal as opposed to the grey and black casing). Take a very fine oil (3-in-1 oil is what I used) and put a few drops on the rails. Slide the head back and forth the full length a few times, and voila! Repeating this process whenever the annoying buzz comes back will fix it.

Hope this helps! I was overjoyed to not be able to hear my 1050 formatting a disk.

> of the best!! -- if it comes out..) in assembler (btw I use A65 -- it's
> great!!), and I have a problem: I want it to be system-reset proof.

Actually, making a program RESET-proof on the Atari 8-bits is very easy. Basically what is happening is when you press the RESET button, you are triggering a NMI (non-maskable interrupt). The routine built-in the Atari for this NMI is what calls ColdStart and boots the DOS section of the OS.

What you want to do is trap the reset vector (the ColdStart one) and insert your own handler, or the start address of your program. It is as simple as:

```
LDA #MyStartVector&$ff
STA COLDSTART
LDA #MyStartVector/256
STA COLDSTART+1
```

Now I have been away from the Atari for about 10 years now, so I don't remember the address of the COLDSTART vector, but you should be able to find it in any Atari mapping book.

Boy this brings me back to my 6502 game development days...

Trust James. It is true. The 2600 CPU was like a giant display processor. You had to do things like load a PM graphic and repeat it down the screen to do any type of real graphics.

One thing they had in common was the creator, though -- and we all know what his next creation was after the 2600/800/Mindset computers... 8^)

While I agree with the rest of Bill and Pattie Rayl's editorial (there wasn't much to disagree with actually), I must pick on this little section.

It amazes me, even though I do it sometimes, that they can criticize an Atari action even though they don't know all that's going on. There was a definite reason for Atari moving Explorer to Sunnyvale and many suspect it is to gain greater control, lower cost, and it even makes sense to have the house mag run from headquarters.

I like John Jainschigg a lot. I'm sorry to see him leave the magazine, since he did an excellent job. I worked with him on an editor/author basis and he is one cool dude. :^) I worry what will become of Explorer after John's last issue, but I know that Bob Brodie and others at Atari will do their best to fill the position.

YES! There have been four issues of AEO so far, and they're only distributed bi-weekly. The next one should be out this weekend. I believe they're distributed on Usenet/Internet via the same mailing list which distributed Z*Net. Unfortunately, I don't know what the mail address is to get a subscription; hopefully someone else can help us out.

Andrew; Thanks for the imput, it got me thinking a little. I've heard minimum production runs are about $500 for PC boards, but I've seen bus expanders that are just ribbon cable with crimp on slots. PC prototype boards are still a little pricey ($30 from JDR), but if I (or anybody else) uses 62 conductor ribbon cable with the crimp on fittings I can just split the cable into a 50 & 12 pin sections for connection to the parallel bus. Perhaps the card enable should be positive logic so people could use the 74LS688 for the !CS of their cards. Anyway, pins 1-50 of the PC card will be identical to the Atari 50 pin bus & let's say pins 51-58 are card select while 59=>5V, 60=>ground (external power supply). 61 & 62 to be determined. I know I've picked up 62 connector stuff, but looking in a JDR catalogue right now I only see 50 pin stuff. Prices are $1.50/ft for cable & $1.69 for each slot connector. You'd need a minimum of one slot for decoding card & 1 more for the 'empty' slot for whatever you needed to add. About $5 for this in parts. $1.69 for each addition slot up to 8 & a small fortune for each board that plugs in! Since there's only about a 100 of us left <g> we could each build one for less then it would cost to have it etched!

2474. Re: Writing A Disassembler

From: Chris_F_Chiesa@cup.portal.com
Message-ID: <61197@cup.portal.com>
Source record: 110722

Some dude named Khan (tmkk@uiuc.edu) (hey, how about a full/real name and a signature?) writes:

>Just for snicks, I'm thinking of writing a disassembler for Atari
>machine code. Yeah, there are tons of disassemblers out there, and I've
>even found one with Mac/65 source code included, but I'd like to try it
>just for the intellectual exercise. What this means is not only do I
>have to implement it, I have to learn HOW to implement it. Are there any
>decent books which actually go through the steps of designing and
>implementing a disassembler? Or is disassembly a sort of "black art" and
>not really covered by regular programming books?

There are undoubtedly many books which explain the principles of assembler/compiler design, and I would assume these would touch, at least glancingly, upon the related inverse operation, namely disassembly. It's remotely possible that some of these, probably dating from the mid- to late 70's or early 80's, might even address the 6502 microprocessor specifically.

One thing I would do if I were in your shoes, would be to obtain and examine source code for existing disassemblers. You've got that MAC/65 source already, but there are other alternatives. Appendix D of "Machine Language For Beginners" by Richard Mansfield (COMPUTE! Publications, 1983) contains type-in BASIC listings for a simple disassembler -- one listing for the Atari and the other for the VIC/Pet/Apple/C=64. The Atari one is 56 lines long, of which 26 are DATA statements. Granted, this isn't a hugely feature-laden program, but it works. (A casual skim-through suggests that the principles of disassembly design, for the 6502 at least, are almost trivial.)

>Also, what is the format for a disk boot record and a binary load file?
>I know the first few bytes of the first sector on a disk contain
>information such as # of sectors to load, address at which to load the
>data from those sectors, a boot continuation vector, etc. Similar
>information exists for each segment of a binary load file. I know the
>information probably is printed in half the Atari programming reference
>books ever put out, but apparently the books I have are all from the
>other half. ;-) Is there a text file somewhere with this information
>that someone could email me? Is it on an ftp site somewhere? This
>information is a pretty basic component if the disassembler is to be
>able to operate on self-booting disks and binary load files.

I've probably got most of the books that contain this information, but I've just moved so they're not all handy for me to look up for you. I DO remember that the I/O User's Manual (part of the Technical Reference Notes) documents a boot-sector format that appears to be for Atari DOS 1, not 2 as nearly everyone has used for the last fifteen years. I believe I found

DOS 2 boot-sector format documented somewhere, but I don't remember where;
possibly in INSIDE ATARI DOS, another Compute! book...

>Thanks for your help.

You're welcome... but who are you? :-)

SpartaDOS is quite a work. I have the SpartaDOS X cartridge (hey, I don't
throw away a computer that I liked so much!), and it is pretty incredible.
In 64K, they stuffed an MS-DOS-like operating system and a mini-ROMdisk
with about 10 utilities including SEA ARC.

SpartaDOS X has some advanced features, too: environment variables,
relocating loader, device drivers, I/O redirection, and a decent filesystem.
And of course, all this functionality is in ROM, so not much RAM is used.
If this product had been released a few years earlier, the Atari 8bits
would have had a much longer commercial existence. It's not hard to extend
a system like this to include multitasking and IPC (although on a 1.79MHz
6502, it may be a _bit_ slow...)

Later,
Steven Ourada

Replies: 0
Origin: Mouse Bbs - Node #3
South Bend, In

Recently there was a write-in
campange to ralley support of an all
8-bit Atari magazine, The Atari
Classics. The effort seems to have
been in vain. Unicorn Publications,
to where the campange was directed,
says it is deffinitely not going to
split off what little 8-bit coverage
it now offers to create Atari
Classics, although would continue
serving the 8-bit community as long
as 8-bit users express interest.
Various opinions all have valid
points. Unicorn believes it is better
to have more interaction between St
and 8-bit owners, not less and it is
better to treat St and 8-bit owners
as equals rather than act if neither
exists in the same reality. There are
just not enough developers and
advertisers to support separate
magazines. How many 8bit only / 16bit
only publications have gone under in
just the past year? Unicorn's Aim
presently carries both St and (some)
8-bit articles and disk of the month
for both.

(232/233+) Lynx Game System:

Well, Soap Box Attack so you can hit stop reading anytime. Patty Rayl addressed this & the demise of another ST only mag in the latest issue of AIM. When I read about the demise of the 'other' ST mag I was touched by how sensitive & rational her comments were. On reading the Classic comments; I was a little upset. AIM is right in their covering all Atari products, but the 1st and last shot for exclusion was NEVER fired by 8-bitters. All you have to do is read this forum to figure out we have everybody from 2600 to ST, IBM, etcetera in here. Go to the freaking ST sig & mention anything but an ST & see what happens. It almost make me embarassed to own an ST! You get comments like [obsolete, get a ST, get out of this sig]. Patty's right in that the Atari community is all things Atari & common interest such as people dropping by to ask about what modem to buy for their clone, but 1/2 of the ST users have serious emotional difficulty with anything other then an ST. You don't really have to worry about an 8-bit mag being split off AIM. As I see it, one of two things will happen:
1) ST users complain about to much Lynx, 8-bit, etc news & leave.
2) The ratio of 8-bit to ST submissions will go up to the point where it will seem like an 8-bit mag.
We really need to get rid of about 1/2 the ST users out there. They're causing 90% of the problems in the Atari world. Sheesh! Even Bob Wooley owns & works on an ST! Does that stop him from being a Club pres & doing 8-bit stuff? He works on IBM mainframes for a living. he could just say any thing with less then a 64 bit data buss sucks, but he doesn't.
I know from my own point of view, anybody that wants to be here is welcome. It would be great to see if any other SIG could make that boast. Right now if you look at AIM the article break down goes something like:
60% ST software review
30% 8-bit umbrella [soft/hard/tutorial]
10% general [lynx, portfolio, news]
I wish Atari Corp all the sucess in the world, but it'd be interesting to see if new software for the ST dries up what they'll have to talk about. The only mistake Jeff & Ben may have made was not waiting until the ST letters to the Editors asking to drop 8-bit coverage piled up.
Well, FLAME OFF!

The + and - voltages are the standard for RS-232, but actually most modems will accept 0 volts as a logic 1 and +5 volts as logic 0. The R-verter interface doesn't have any voltage conversion, just a 1488 or 89, I forget which, and one other chip (I think it was a 74LS244, but it's been a while since I looked). I'm not sure if it's true, but I heard that most RS232 interfaces for the 8-bit only output 0 and +5 volts. The first 2400 bps modem I got was one of the few that require a negative input voltage. I use that modem with another computer now.

2480. Omniview and Bobterm?

Newsgroup: comp.sys.atari.8bit
Date: 1992-06-28 21:22:10 UTC
From: xx140@yfn.ysu.edu
Message-ID: <1992Jun28.212210.7712@news.ysu.edu>
Source record: 110728

Hello,
I am using an Atari 130XE with an Omniview chip
installed. This chip, as you may know, lets the Atari 8-bit
use 80 columns of text instead of the standard 40 column screen.
However, I cannot get the chip to work with my terminal programs.
I usually use BobTerm or Express 850, but I would use any
terminal program if I could get it to also utilize the OmniView
chip. The chip came with a terminal program, but it is only good
for 1200 baud and it doesn't have the correct handler for my
Avatex 2400 modem.
So, if anybody can tell me how I can get the OmniView
chip and terminial program working together, I would be very
thankful. It sure is a pain looking at 80 column output on
a 40 column screen.

Thanks,
John Medeiros

Gee, I don't know, but I was thinking that with something addressed
in the PBI addressing range, my 1200XL could then have an internal
Rs232 and Parallel Interface, heh heh.

From: aa620@cleveland.Freenet.Edu
Message-ID: <1992Jun29.044630.21877@usenet.ins.cwru.edu>
Source record: 110730

The only way the 8-bit computers will continue to live is if
software is continuing to be produced for it.

This is what the Cleveland Free-Net Atari SIG will be attempting
to do in an effort to create an environment for 8-bit programmers
and developers.

In the next version of the Atari SIG, soon to be released in a few days,
there will be a new programming/developing forum specifically for
the 8-bit computer programmer.

We wish to get a "Resource Center" for this forum.

The resource center would consist of docs, tutorials, and any other
text-files that will help users program the 8-bit computers.
It will also help users develop hardware for 8-bit computers.

If you have ANY text-files relating to programming/developing,
please send them to this address. We will use it to help make sure
programs are continuing to be produced for it.

THANKS!!!!

Sincerely,

Len Stys

2484. Question: DOS Binary Headers

Newsgroup: comp.sys.atari.8bit
Date: 1992-06-29 07:44:16 UTC
From: etxansk@garbo.ericsson.se
Message-ID: <etxansk.709803856@garbod20>
Source record: 110732

I converted some games from tape to Atari DOS 2.x format last
summer, and then I noticed that the binary header identifier
bytes 255, 255 are necessary only in the leading chunk of
binary data. t

Like this:

<255> <255> Identifies binary file.
<first addr lo> <first addr hi> Start address of first part.
<last addr lo> <last addr hi> End address of first part.
<data ...> First part's data.
<255, 255> This pair of 255s is optional.
<first addr lo> <first addr hi> ...
<last addr lo> <last addr hi> ...
<data> ...
<etc> ...

Could someone please tell me, what does Atari binary format specs
say about the 255, 255 byte pairs (except that one is always
needed in the initial binary part).?

Thanks in advance,
Anders Skelander

In those I have seen, the technique is pretty straightforward: set up a location counter which points to the spot in the buffer from which the next byte will be fetched. In a loop, fetch the next opcode, use that as the index into a table which tells you the mnemonic and addressing mode, fetch the operand bytes (if any), and regenerate the source text for the instruction. That much is fairly straightforward to implement, and I've seen several disassemblers for the Atari which do this much.

The tough part comes in when you want to produce something more useful in helping you understand what the program is really doing, or when generating source which can be easily modified and reassembled. A step in the right direction is CODEBUST, which lets you generate a list of labels and automatically sticks them into the disassembled output. Thus you get output like STA DOSINI instead of STA $000A (or whatever the address is for DOSINI).

What I'm really after, though, is the Atari equivalent of SOURCER, a commenting disassembler for the IBM PC. It is a multipass disassembler which can automatically discern code from data, generate internal labels for location, subroutine, and data accesses, documents all calls to the OS with their function and arguments, etc. etc. It lets you create a definition file with labels (a la CODEBUST, only moreso), as well as define ranges for code and data which override Sourcer's automatic determinations, plus many many other features I've left out.

I don't see myself recreating all the power of Sourcer for the Atari, but I would like to learn how some of it's magic tricks are actually done. The one I'd most like to see explained is how it "knows" about

data which is embedded in between a couple of code blocks. Something like

```
LDA #$00
JMP $1234
.BYTE "This is some data...", $9B
```

will not be handled correctly by most disassemblers. They'll disassemble the JMP instruction, and then blindly charge ahead and attempt to disassemble the ASCII text string which follows it. The "smart" disassembler would realize that there might not be valid code immediately after the JMP, and would also follow the JMP to determine the target EA and continue disassembling from that point.

Anyone interested in discussing how such features might be implemented? Anybody care? ;-)

On the 2600, programmers had to know the exact timings of each of the opcodes, and you ended up doing some really weird things to create graphics, since there were just one register to control the PM's. If you have ever seen some of the SPARC processors or other pipeline CPUs, you will understand. You a X number of cycles to get an operation done, so that you would be ready for the next scanline, and I do mean X number, EXACTLY. It took some getting use to.

2488. sio2pc utilities

Newsgroup: comp.sys.atari.8bit
Date: 1992-06-29 16:00:02 UTC
From: coffin@mars.ced.utah.edu
Message-ID: <1992Jun29.160002.10711@fcom.cc.utah.edu>
Source record: 110735

Hi all, I'm interested in how many sio2pc users there are out there. I've written a couple of useful utilities and will post them if enough of you are interested. The utilities are as follows. DIRA, directory of an atari disk image. CPA, (copy atari) coppies a file to/from an atari disk image. Also does EOL translations both ways with a /A option. RMA (remove atari) removes (deletes) a file from an atari disk image. I'm still working on these. DIRA is done. CPA is done. RMA is almost done. I hope I haven't recreated the wheel. Somebody let me know if these utilities already exist somewhere. To my knowledge the only utility that exists is the one Nick Kennedy includes with sio2pc. Its called makadisk and it is very primitive, prompt driven, provides no text translation and only goes one way. The utilites I've written are all command line driven, so you can put then into batch files. Anyway send e-mail to me if you are interested or if you have other info on the subject.

I've got the same question: how many people reading this group use sio2pc? I've also started a utility program for sio2pc. Mine is either command line or menu driven, and works for any size mydos 4.5 disk, or atari dos 2.5. It isn't tested very well yet, so if someone would like to help me out and test it, send me a message. my program will do: copy to/from atari, directory list, change dir, wildcards, delete file, rename file, and make a dir.

I'd be interested in seeing what other people have done, to see if I need to finish & get rid of the bugs :-).

writes:
> We've recently heard that Atari Explorer is about to be
> moved "in-house". John Jainschigg has shared with us his
> thoughts against moving out to Sunnyvale (into what some
> have called "the pressur cooker"). It is his decision to
> not accompany Explorer to Atari Corp. He will do only one
> more issue from New York.

What's the difference? Atari Explorer is ALREADY a puppet of Atari
Corp, whether located in Sunnyvale or New Jersey. The way they
take two years to review a product, or the way they rip off their
advertisers by accepting payments for advertising space in non-existant
issues sounds a lot to me like the same kind of incompitency that
plauges Atari Corp. I'm still trying to recover money from them for
an ad that was to have appeared in a non-existant issue from last year!
I keep getting the same kind of "the check is in the mail" runaround
that I'm more than used to getting from Atari Corp. Interestingly enough,
Atari Explorer deposits its checks not in New York or New Jersey,
but directly into Atari US Corp's account at the Wells Fargo bank in
Sunnyvale. After 6 months of phone calls and promises, I am now told
that I need to resolve the problem with the folks in Sunnyvale.
So as far as I'm concerned, it doesn't matter whether Atari Explorer
is located in Sunnyvale, New York, or Upper Tibet, they are still just
a useless propoganda machine for Atari Corp.

BOYCOTT ATARI EXPLORER! Support AIM, ST Informer, Current Notes, Atari User,
Atari Advantage, PSAN, and all of the other publications that actually
do something constructive.

I don't yet, but I've been seriously thinking of puting one together,
perhaps modifying it a bit to work with the parallel port (it would
eliminate the level conversion circuitry and free up a precious serial port).

I guess you can cunt me as a "prob'ly."

2492. ATARI CLASSICS UPDATE

Newsgroup: comp.sys.atari.8bit
Date: 1992-06-29 22:00:21 UTC

********** A T A R I C L A S S I C S **********

UPDATE UPDATE UPDATE UPDATE UPDATE UPDATE UPDATE UPDATE UPDATE UPDATE

The last Update was posted to the Net around the end of May but many people did not see it as I was experiencing difficulty with my USENET connection, so it went directly to naucse then out to the Internet. My apologies. I will try to bring everyone up to speed on the past 7 week's developments.

Following the official close of the mail-in Campaign on May 2 & subsequent dissolution of the Campaign Committee, Jeff McWilliams shipped me all the cards he had received as of the first week of May. (During the first week of June he also sent me a 2nd shipment of cards, consisting of late returns/stragglers.) The final count of returned cards was just under 600, the number 580 comes to mind.

I spent a couple weeks sorting all the cards into alphabetical order, reading all the comments on every single one, and taking notes. Jeff McWilliams also sent me a copy of the Campaign database; at the moment there is a problem with merging in the final batch of respondents but he is working on that & expects to have it squared away soon.

With notes in hand, during the last week of May I commenced work on AC's Publication Manifest, a document that describes in detail our proposal for the organization and functions of the magazine. This turned out to be a non-trivial task. It took 5 weeks. My barber noted an unusual of grey hair on my head...

The Manifest was completed June 28. It was submitted to Unicorn Publications early today for their consideration. There has as yet been no response, but of course it's very early & the Manifest runs 38K of text, so it will take them awhile to digest it all. With the submission of this document to Unicorn, the pledge made by the Campaign Committee to submit our ideas to them has been fulfilled. The ball is now in their court, we are awaiting a response, & we naturally are very anxious. The next few weeks will no doubt be very critical to the birth of AC, as delicate political and financial arrangements are debated until both sides achieve a resolution of their respective concerns. At the moment I am very optimistic that a positive resolution of concerns will be obtained, leading to production of the Premier Issue of Atari Classics.

Within the past few weeks a few irresponsible individuals have taken the proposals set forth in the Campaign literature, allowed their paranoid fears to run rampant, and expressed their concerns directly to Unicorn. If these people had instead expressed their concerns directly to the Chairman of the mail Campaign, Jeff McWilliams, he could have dispelled their fears in short

order. The main thrust of the concern seems to be loss of 8bit coverage in AIM by splitting it off as suggested in the Campaign letter. Individuals who own both 8bit & ST machines are not happy about this, & Unicorn has strongly rejected the idea of removing 8bit coverage from AIM.

This issue was a subject of considerable discussion within the Committee even while the Campaign was in progress, & by the time the Campaign ended we had pretty much arrived at the same conclusion ourselves: i.e., that there should be continued 8bit coverage in AIM pretty much as it has been, perhaps with a certain amount of shared material between the two publications. This would satisfy the demand for an 8bit-only publication while not forcing those who are satisfied with AIM in its present format to make an unhappy either/or type of choice. So, in effect, we of the Atari Classics movement are in agreement with the position taken by Unicorn & tend to view the recent hubub as much ado about nothing. I would point out that whereas the number of these type negative responses to the Atari Classics effort is fewer than 10, I maintain it is a decidedly minority opinion compared to the nearly 600 positive- even rabid- responses the Campaign garnered.

Recent posts to the Net seem to suggest that Unicorn's rejection of splitting off 8bit coverage into AC constitutes a rejection of the entire Atari Classics movement. Not true! In their response per the June AIM, Bill & Pattie made their position clear & left the door open for the exploration of possibilities related to our effort. As far as I am aware, relations between AC & Unicorn remain cordial, both parties have contined to express interest in discussing proposals, & we have exploited the open door by finally submitting our detailed plans for their consideration.

Dealing with this tempest-in-a-teapot has had the effect of siphoning off my time & energy that should have been devoted full-time to AC. It strikes me ironic that so far the greatest threats to the success of this admittedly shaky enterprise have arisen from the ranks of the 8bit community itself. Idle & irresponsible speculation will only damage our cause. I urge everyone to please exercise restraint & be patient. Have faith that we are doing the best we can to fulfill the promise of the Campaign & bring into being a unique user-based 8bit-only publication. These are very very anxious & critical times for all of us who support the movement.

I said this before, I'll say it again:

"The dough must be allowed to rise, before we can bake the bread."

Which Address?? Many people read this in digested form and REPLYing to a
specific message is nearly impossible due to UUCP Path addressing (At least
from VAX/VMS site).

> THANKS!!!!
>
> Sincerely,
>
> Len Stys

I personally think having a developers forum (for BOTH hardware and software)
would be great. Since we all know that Atari will be of no help in
development, we are really on our own. Since there is really very little
profit in Atari 8bit development (relative to other platforms) the people
that do, are, in my opinion, doing it because they want to. I think this leads
to better quality software and hardware. I also think the 'non-corporate'
attitude will also lead to a fairly free exchange of ideas; everyone does not
have to re-invent the wheel, so to speak. An occasional newsletter or
something would be even better. Anyway....I would really love to see all
of the people out there that are interested in software/hardware development,
band together. This type of organization would give us 8-bitters a
development advantage over any 'modern' platform.

Another issue (About 'Atari Classics'): There seems to be a debate about whether AC is a good idea or not. I personally think that there is a need for a magazine that is written based on the assumption that people understand there machine. Sure, there is always room (and an obligation) to help out the newcomers, but what about the hard-core technical stuff that some of us thrive on. AIM, being the great magazine that it is, does not have the room for such diversity. Even if AC were a reality, I would continue to look forward to and enjoy AIM. I think that if there are enough of us to warrant a developers forum, there certainly should be enough people interested enough to subscribe to AC. Don't we deserve our own magazine???

Does anyone happen to know Doug Wokoun or how to reach him? He was the author of the Hyper E: screen accelerator and the C-KEY ms-dos type keyboard emulator (gave crtl-c, crtl-s, and crtl-q, as well as DMA and Print Screen hot keys). I am wondering what other utilities he may have written, what the the latest versions are, or is there some shareware fee (I came across these on an unknown disk a while ago).

My versions:
C-key v1.5 06/10/91
Hyper E: v1.2JH 17-nov-90

Thanks a lot.....

In order to use Omnicom at 2400 BPS mere choose option 'C' for custom
and enter in the hex code of 0C for baud rate.

Simple, nice and neat.

Source record: 110747

The secret is to choose option 3 for setting baud rate, which is the custom baud rate setting. Then you need to know what the AUX1 byte sent when the program does a XIO 36 is responsible for. The lower four bits are for baud rate. A value of 11, or $C is hexadecimal, will set the baud rate to 2400 baud. I think it asks for the total value here, so mine is set at $8C for AUX1. That is all there is to it, be sure to answer Yes to the save parameters option, and this will come up as a default each time Omnicom is loaded, taken for granted the setting file is on the default disk drive, in the root directory (usually drive 1).

>motor on and off using a bit in PORTACNTL (or was it PORTB?)
>but how do you read the IRQ line?
>Please describe how you are putting out characters
>using the serial port.
Actual output is done thru the parallel ports.

PIA has two ports each 8 bits wide. Those two ports are controlled
with a control register for each port. Within those control registers
you have access to two more lines (each) that have a myriad of possibilities.
Usually (in non-Atari applications) they are used for handshaking. They are
available on the serial port and are usually called MOTOR, PROCEED, IRQ (?)
and COMMAND.
MOTOR is used for turning the tape drive on and nothing else. Since noone
uses a tape drive anymore (har) this line is unused. COMMAND is used in
the SIO protocol to indicate that a command byte is on the way over SIO.
PROCEED and IRQ are unused. (as far as I know)

I don't have my notes with me here, but there's a special feature in the
PIA called autostrobe. Whenever you write something on one of the PORTS
(if you configured P?CTL properly) PIA generates a STROBE over one of the
control lines. Now you just look for an ACK over either PROCEED or IRQ.
(I did polling there like this)There is also a feature on one of the ports
I believe it's PORTB which features auto-ACK on reading of the port.

I think resetting of the interrupt is done by reading the appropriate
port register. All this information is incidentally available in

68000 Assembly Language by Lance Leventhal et.al.

In case you ever wondered what else the other 6 bits where good for in the
PIA.

Nat!

>
>What is 'Atari SIG'? I assume this is part of the Cleveland FreeNet, which
>I have never frequented.

Thank you for your interest in the Cleveland Free-Net Atari SIG.
Here is the entry about it in this group's FAQ list:

What is the Cleveland Free-Net Atari SIG?
The Cleveland Free-Net Atari SIG is like a huge public bulletin board
system. Anyone can access the Free-Net via modem at (216) 368-3888. Those
persons with full Internet access can TELNET (this does not mean FTP) to
freenet-in-{a,b,c}.cwru.edu (129.22.8.{82,75,76}). Applications for accounts
are handled online. Once logged-in, type "go atari" to reach the Atari SIG.
Those who add their names to the Atari SIG members-list are automatically
members of the official Atari users' group CAIN - Central Atari Information
Network.
CAIN carries Z*Magazine and the Info-Atari8 Digest, as well as many
product reviews and all sorts of other information related to Atari products,
all online. Its mission for 8-bit users is as a depository for any and all
information in ASCII format related to the 8-bit Atari computers.

>
>Which Address?? Many people read this in digested form and REPLYing to a
>specific message is nearly impossible due to UUCP Path addressing (At least
>from VAX/VMS site).

Actually all posters to this group ought to take note of this. The
Info-Atari8 Digest does not reproduce the From: line, just the Path:
line of your postings. That's why it's important to leave your
name and address somewhere in the body of your message such as in a
.sig file.

The Atari SIG address is xx004@cleveland.freenet.edu. The Atari SIG's
Primary SIGOp is Len Stys, his address is aa399@cleveland.freenet.edu.
The 8-bit Atari SIGOp is me (I have a .sig at the bottom of this
message)

>I personally think having a developers forum (for BOTH hardware and software)

> a rs232 port? A way that would cost < $20? How fast could it handle?

No, not really. Two problems: acceptable 80-column display, and keeping up with 19.2k input.

Software 80 columns (Antic mode F) is kind of ugly. No, it's extremely ugly. When I was using my XL exclusively, I got a hold of someone's 80 column assembly source, and wrote a minimal terminal program for R: with it. I enhanced the display code with display list fast scrolling and a PMG coloured cursor. Emulation was ADDS ViewPoint because it was the tersest emulation the system I called would support. It could keep up with 2400 bps, but I never tried anything faster than that. I doubt it could do a lot faster. Btw, no file transfer protocols, no capture log, and the code is buried somewhere in a box of unlabled disks. :)

Atari's XE-whatever 80-column joyport box would look a lot nicer, but I think speed problems would be even more severe. Scrolling is always the bitch. You might be able to paint characters at 19.2k (I doubt it, though), but there's no chance at all you can scroll at that speed. Not unless the box has hardware support for scrolling... I've never taken the drivers apart, so I'm really not sure. Again, I doubt it.

I've seen old dedicated 80-column terminals going for $20 or less at local swap meets here in Vancouver. I think that makes a lot more sense than trying to get a little Atari to do it. Comes with a decent monitor, too.

Re: 19k/80 columns
I voting for it can't be done. I'm not the greatest ML programmer that ever lived, but I've tried & I can barely get 2400 baud. Still thinking of ways to get it to work reliably, but the problem is to do an 80 column display you have to use GR.(8+16) mode & do your own character generation. That's fine until you reach the bottom of the screen & have to scroll 8k of screen up 8 scan lines! Just guessing, but this takes about 1/10 to 1/2 second. At 19,200 baud you've just lost 20 to 1000 characters. I suppose you could do a software kludge, something like send a ^S everytime you need a line feed, but that wouldn't be a true 19,200 baud would it? It maybe able to work if you used a hardware 80 column display, but unless you did the Wooley one you're talking about much more then $20. Sending & recieving W/O displaying the data or a 40 column ANTIC mode may work.

Jeff,
I got my OmniView chip with the OmniTerm/OmniCom program
when it first came out. I know that 2400 baud modems were not
that affordable then, so most 8-bit terminal programs just
supported 300 or 1200 baud. If you know how I could get my
OmniCom to work at 2400 baud and with my P:R: Connection and
Avatex 2400 modem could you please let me know?
Thanks,
John

Couldn't you set up a display list with a new data adress specified
every eight scan lines? Then you could scroll simply by shuffling
pointers during vblank and redawing the bottom line. Of course there
may be problems involving memory boundaries, but I'm not sure.

If you have to do a copy, try to unroll the loop for an entire scan
line, i.e. 80 sequential

```
LDA (SOURCE),Y
STA (DEST),Y
INY
```

lines. If you put it in a loop, you'll add an extra instruction
per iteration, which can make all the difference in the world. You
can trade size for speed by unrolling this either more or less.

Just some thoughts.

I have just one word for you: INTERRUPTS.

Any UART worth its silicon can generate an IRQ (interrupt request) when
it has received a character from the remote system. All you need to do
is wire up a simple UART-based serial port to the parallel bus, and
write an interrupt handler for it. The Atari can do 19.2Kbps and faster
over the SIO bus to disk drives etc., so why not the same kinds of
speeds through a serial port?

>Still thinking of ways
>to get it to work reliably, but the problem is to do an 80 column display

Well sure. The MIO already does this. But it doesn't mean the screen can keep up, and recieving at 19.2k without any way of handling the data is kind of pointless.

If the 2600 was such a hunk of crap, why was it made that way in the
FIRST place at all????

And now for a totally philosophical question:
Why didn't Atari make the ST's compatible with the 8-bits?
I feel that Atari corp really spat in the faces of all those people who
spent a lot of money on hardware and software for the 8bits!!
The new ST's COULD have been made compatible.
There could have been a faster CPU with more commands, better features,
more memory access abilities, multi-tasking etc, but STILL be able to
use old 8-bit software.
I mean, look at IBM!! They made their computers totally compatible,
from the earliest 64K 8088's till today's 50Mhz 486.. How was THAT done,
and why didn't Atari (or Apple or Commodore, but we don't care.. :))
do the same?? Atari could have been the largest computer company in the
world by now!!!!!
Anyone think differently? Comments? Send 'em on to the newsgroup.
I'd love to hear comments on this interesting (for me at least) issue.
Or has it been raised before?? I'm new on this net..
Bye!! -Itay

One reason is that it was made about _14_ years ago! And given that it was
a huge success at the time, I don't think many people called it crap then.

>And now for a totally philosophical question:
>Why didn't Atari make the ST's compatible with the 8-bits?

Because they felt it was time to move on.

>I feel that Atari corp really spat in the faces of all those people who
>spent a lot of money on hardware and software for the 8bits!!

Because this equipment is now useless?? No, the all that hardware and
software for the 8bits still does exactly what it did before the ST's.
Yes, Atari did drop their support for the 8bits eventually, but that
was a few years after the ST's came out. Do the companies you mention
below all give full support to thier 13 year old computers?

>The new ST's COULD have been made compatible.

For what reason?

>There could have been a faster CPU with more commands, better features,
>more memory access abilities, multi-tasking etc, but STILL be able to
>use old 8-bit software.

Use old 8bit software on old 8bits. Compatibility can only go so far, see
below.

>I mean, look at IBM!! They made their computers totally compatible,
>from the earliest 64K 8088's till today's 50Mhz 486.. How was THAT done,

>do the same?? Atari could have been the largest computer company in the
>world by now!!!!!

You can in general run your 8088 programs on your 80486. That's fine, but
it also means that programs written for the 486 have to work
around all the cruft that's accumulated on the Intel series in order to
keep it compatible. 486 systems with 16M of RAM still look like 640K
systems to older MSDOS programs, etc.

Luckily, Atari didn't take that road. If they would have, they wouldn't have
gained the mild amount of respect and money they have from the ST line. Far
from being the largest computer company in the world, they would have went

under quickly.

As far as I know, nothing that you haven't already figured out - namely,
that it IS required as the first two bytes of a file, to identify a
binary-load file, and that it isn't necessary anywhere else within that
file.

Hope that helps.

What do you mean by this? The incoming data goes into a memory buffer at
19.2Kbps, and you take characters from the buffer and display them on
the screen at whatever rate you want. The screen doesn't have to "keep
up" with anything. When your buffer is near to being filled, your
handler would send a ^S to the host automatically, and when most of the
data has been displayed on the screen, you send a ^Q to start the flow
again.

>and recieving at 19.2k without any way of handling the data is kind of
>pointless.

But you have a perfectly viable way of handling the data: it's called
your interrupt service routine.

The software is straightforward. The hard part would be wiring up the
UART to the parallel bus.

I mean, look at IBM!! (does this sound familiar, it was also in your argument). I think IBM is the perfect example of why NOT to worry about compatibility. I mean all the IBM is is a big fast upgraded piece of crap. I'm not saying that there's anything wrong with the Atari 8-bit, I had a couple of them and programmed on them for several years. I believe that when you have new technology (a new generation graphics chip for example) it is O.K. to dump compatiblity. The only thing that will make use of the new features is new software. Even if I did buy the original IBM PC I would not keep upgrading the memory, CPU, and graphics card; eventually I would have bought a whole new machine. As long as I am buying a whole new machine why limit myself to a compatible one? I mean the new machine would be purchased to allow you to run new software also, possibly software that would not work on your older 'compatible' machine anyway. In other words if you look at the big picture, people are essentially buying IBMs so that they have the ability to run that 6 year old software but nobody is actually running it! And what do you think IBM is upto even as we speak? Well, they are working on a new machine along with Apple called something like the 'Power PC' and guess what?, it's not compatible with either IBMs or Apples system! Another point I just thought of by mentioning Apple, are you saying that Apple screwed up by making the Mac and not being compatible with the Apple II?

By the way, I have never owned and probably never will own any sort of 'PC Compatible'. Last year I moved to the STe and just recently this year I sold off all my 8-bit stuff (100% of my home computer time now goes into programming a couple of projects on the STe).

P.S. I still have a De Re Atari for sale if anybody is interested.

Source record: 110566

I'm sorry guys, you'll have to forgive me if I mis-read your thoughts about this issue.

I'm a little confused. People have cited our June issue, and the comments in it about the Atari Classics campaign. I don't see how that leads to the idea of no 8bit only publication. What Bill and I were saying is how we feel AIM represents a lot of varied readers, so we would not be willing to turn AIM into an ST only mag. AIM coverage would continue as it has over the last several years, picking up Portfolio and Lynx along the way.

One person was upset over the languag we used. That is understandable, since we a little surprised at the kit when we saw one (after the campaign was over), when the kit said we would split AIM up. We were a little taken aback at the presumptions it seemed the campaign was taking! :) Bill and I sent off a letter very similar to the nots in AIM to Ben and Jeff, xplaining our thoughts on the whole subject. Ben got back to us, explaining how that phrasiology (sp?) happened to get into the kit, and that en and Jeff felt very much as Billand I did/do.

(please forgive the typos -- I'm typing faster than the net can handle, it seems)

So, everything is fine.

I just got Ben's maifest today, and we'll be getting back wih him as soon as we look it over and make our suggestions/changes.

Again, if I misunderstood the messages, please forgive me, since I'm relatively new to the UseNet. In fact, we made an effort to get on the net because of the Atari Classics discussion/campaign.

Source record: 110568

Ed,

I don't completely understand your criticism of what Bill and I said in the Editorial Rampblings for June. Granted, there may be times when no one can no the actual reasons Atari does stuff unlss they work in Sunnyvale (and not even then, in which case, you'd have to look in Sam or Jack's mind!).

However, I think we have a better than average chance of figuring what those reasons could be. I guess the biggest complaint would be, If it's not brroken, why mess with it?

You say Atari would gain more control over Atari Explorer by moving it inhouse. Atari officials (mostly Bob Brodie, I think) already ok each and every page of AE efore it's printed. To me, that's a lot of control already.

You suggest Atari could save money. Atari Explorer isn't printed in NY, but PA. If atari kept the same printer, and there's no reason to think they'd change, thre's no savings there. Sure, they wouldn't have to pay John, but in exchange, they have to pay someone who lives in CA, with a very high cost of liivingrate. Moving AE inhouse also means Atari has to get new art directors and graphics artists, which John already had on staff, not to mention new support personnel like an advertising persons. And, adding those new people are all on the assumption Sam's willing ot pay for nw employees when there've been big layoffs. The gossip going around now is that Sam's not even willing to authorize the salary for an editor, and I know one person can not put out an Atari explorer alone.

My view is clear: I think AE should be left in John Jainschigg's hands. If any one else would like to get me on the soap box, please join in! *huge grin*

Source record: 110569

I just had a brainstorm concerning the long-standing bottleneck of "scrolling the screen while keeping up with >2400 baud serial data."

Why scroll the displayed data at all? One of the Atari 8-bit's big pluses is that the display memory can be ANYWHERE in memory, pointed to by a display list. We've all seen instantaneous page-flipping, and what's that but a "scroll" of an entire screen that happens too fast for us to even SEE? :-)

Something along the lines of reserving two screens' worth (or so) of memory and managing it, and an associated display list, as a "ring buffer," ought to let you scroll as fast as you want -- you've only got to update 60 bytes or so at ABSOLUTE MAXIMUM, and I'm absolutely certain you can get away with manipulating far fewer than that -- by moving the "window," defined by the Display List, over the data to be displayed. Of course, you can't use the built in E: device, but if you're doing terminal emulation you probably aren't using that anyway!

Comments?

bruck> And now for a totally philosophical question: Why didn't Atari
bruck> make the ST's compatible with the 8-bits?

1) the 6502 has no op code compatible successor. That is the 286 will
run 8086 code. The 386 will run 286 and 386 code etc.. It was
relatively easy to move to the next level of power and keep
compatibility. The 6502 was a dead end. Even the Apple IIgs isn't a
real upgraded Apple as much as it is a new machine.

2) For the most part, the people who designed the 8-bit were no longer
at Atari.

3) With no simple upgrade path and far more powerful computers coming
out, Atari correctly introduced a new line (same as Apple and
Commodore)

Maybe there could have been a true 16-bit 6502 that code run the code
of the original. the 65816 had a 6502 mode, but to use the new
instructions and extended addressing, it had to be in 816 mode. So
you could make one that run in one mode for compatibility and one for
new stuff..

bruck> I mean, look at IBM!! They made their

bruck> today's 50Mhz 486.. How was THAT done, and why didn't Atari (or
bruck> Apple or Commodore, but we don't care.. :)) do the same??

Continued line of processors
The price paid is that the machine does not live up to the potential
of the processor. Most still use the ISA bus and so on...
Still, more and more software is coming out that will not work on the
8088 and 80286.

bruck> Atari could have been the largest computer company in the world
bruck> by now!!!!!

Not a chance. Not even a little one.

Well, you've certainly stirred up some comments. I built my 1st homebrew computer in 1977, I remember I rushed out & bought some Intel 256 by 4 bit static RAMs when the price dropped to $4.95 each. A whopping 1/4k for $10! Since someone else mentioned the birthdate of the 2600, you can guess why the "Old Atari" kept it the simpilest machine possible. Still it sold for over $100 & everybody had one.

Really the topic of compatability has come up a number of times. Bob Brodie hizself said they didn't like the way things were going in 65XX land, so they went with a processor with a future. Really the Amiga is the sequel to the Atari 8-bits. There were a series of articles on the topic in AIM I believe. Whole story boiled down to some Atari 800 engineers starting a spin-off funded partly by Atari. When Uncle Jack took over Atari they tried to sell the thing to the "New Atari". Ended up Uncle Jack told them he wasn't going to buy it, he was just going to wait until the note came due then get it from the bankruptcy. Soooooo.... they sold it to Commadore.

Now why they didn't use a 65XX in the Amiga I don't know, but I remember when I got discusion on Atari Base with Brodie & others the Apple ??? thingie that used the 65816 was mentioned. I said at the time that the projected Super NES was going to use a 65816 & I'd reserve judgement on the issue until it was launched. Just saw a news report. They sold 2 million of those puppies last year & expect to sell another 6 million this year. There's something like 75 titles out already. Why use a software compatable procesors with a enhanced instruction set & video processor? 75 titles in 4 months. I do a fair amount of ML programming & I really doubt if accessing the new features of the 65816 would be that tough. Still, Atari had decided the video game market was dead so they didn't even try. Meanwhile the owners of Nintendo has bought the Seattle baseball team & are making money. I wish Atari would've stayed in the video game field. They may have made enough money to keep the money losing computer divison going.

>the "Old Atari" kept it the simpilest machine possible. Still it sold for
>over $100 & everybody had one.

I bought mine for close to $250. When it was yanked from the
market last year it sold for $30.

It is interesting to note that the 2600 can display more colors (128)
than the Apple II, Nintendo, and Commodore-64, something fairly
important for a game machine. Progress isn't always nice and
linear...

You sound like an Amigoid. ;-)

>I'm not saying that there's anything wrong with the Atari 8-bit, I had a
>couple of them and programmed on them for several years. I believe that when
>you have new technology (a new generation graphics chip for example) it is
>O.K. to dump compatiblity. The only thing that will make use of the new
>features is new software.

Obviously you don't buy much software. Are you seriously telling me that
you throw your ENTIRE software collection out into the dumpster whenever
a new machine comes out? That it's totally unimportant that your
current software, which costs some users THOUSANDS of dollars, run on
your new machines?

If this is the case, you are part of a TINY minority of computer users.
Most people don't want to start all over from scratch just because they
got a new machine. That's the beauty of the modular approach taken by
ISA machines: you can upgrade the processor, memory, mass storage,
video, or whatever you want, and almost all of your old software will
still work. Sure, you have to write new programs to make use of new
capabilities of your upgraded machine, but you also have the option of
STILL USING YOUR OLD STUFF, TOO. You see no value in that?

>if you look at the big picture, people are essentially buying IBMs so that
>they have the ability to run that 6 year old software but nobody is
>actually running it!

I think your "big picture" is severely distorted. Perhaps you should use
some Windex on the glass? ;-)

BTW, you mentioned you program on an ST now. Have you noticed that newer
versions of the ST, although equipped with more memory and faster
processors, are (*GASP!!*) still compatible with earlier STs? Why do you
think that is?

But that's just what I mean. Say for arguement's sake that you can paint characters (on average) at 9600 bps. With a decent UART/ACIA/whatever you can recieve at 19.2k, but with only a 50% duty cycle. Having to use software handshaking doesn't meet my definition of "keeping up".

> The software is straightforward. The hard part would be wiring up the UART to

Do you really think so? If you use an ACIA with an internal baud rate generator, I'd say it's the other way around. Both are straightforward, but the software will take more time and effort. Especially if you want to emulate an existing API like the R: device handler.

It's not a new idea. But you can be proud of the fact that you thought of it independently. :)

> Something along the lines of reserving two screens' worth (or so) of memory
> and managing it, and an associated display list, as a "ring buffer," ought to
> let you scroll as fast as you want --

A single screen's worth of memory is enough. Whenever you scroll the screen one line, the line at the top becomes the line at the bottom. All the other lines are untouched.

> you've only got to update 60 bytes or so at ABSOLUTE MAXIMUM, and I'm
> absolutely certain you can get away with manipulating far fewer than that --
> by moving the "window," defined by the Display List, over the data to be
> displayed.

Yup, you could use a contiguous chunk of screen ram and scroll the entire screen by changing the single pointer in the DL LMS instruction at the top. But then you've got a special case... sooner or later you'll run out of buffer space and you'll have to start at the beginning again. That might mean block copying the screen, too. Instead of all those hassles, I took the other approach. I allocated just enough screen RAM for a single screen, and each text line has it's own LMS instruction with pointer. So, consider the performance like this:

normal scrolling: 920 byte move + 40 byte clear per line
DL 'block' scrolling: 2 byte pointer change + 40 byte clear + special case
DL 'line' scrolling: 50 byte pointer change + 40 byte clear

Btw, the 'line' approach is the only one that works when emulating 80 columns with Antic mode F. Remember that Antic can only address a 4k memory space? And a full screen is almost 8k. You'll need to split the screen with a midscreen LMS anyways, and as you scroll the screen that LMS will have to be in different places in the display list. Since the display list has to be all LMS instructions, you might as well scroll by modifying the 25 LMS pointers instead.

Hm... an optimization just struck me. Perhaps all possible display lists (there's only 25 of them) could be precalculated and stored, and then super-fast scrolling performed by just pointing DLIST at the right display list for the current buffer position. It would eat up a little bit of RAM, but then a scroll would be 2 bytes changed, 40 cleared... or 2 bytes changed, 320

cleared for mode F.

The PMG cursor really helped things, too. Instead of clearing 8 bytes and painting 8 bytes in mode F, I just had to change the horizontal position of the cursor and let Antic do the rest. The cursor was coloured and showed through the characters, too. Looked kinda cute.

Why not keep your old machine also? Is it illegal where you live
to own 2 computers at one time? You make it sound like you HAVE to throw
away your old machine the instant you buy a better one. In fact I kept
my 8-bit for a year and a few months after I bought my STe and by that
time I had aquired a shareware version of just about every utility that
I normally used on the 8-bit and most of them are better than the ones
on the 8-bit. As far as games go it only takes one good ST game to beat
my whole library of 8-bit ones (any time spent playing the 8-bit games
could instead be used to play the one ST game and would still be more
entertaining). Also, I would rather just have both machines than have the
new one and a perfect emulator of the old one. (That way they both could
be used at the same time more efficiently).

> BTW, you mentioned you program on an ST now. Have you noticed that newer

They do not yet have a new technology that cannot be fully serviced
by the ST line.

Thanks You For Playing.

Perhaps it doesn't meet your personal definition, but it does meet a
practical one.

Let's face it, if you're reading text from some remote service, you
can't read much faster than 2400bps anyway. You'll be pausing and
unpausing the display far more often so YOU can keep up. And for
downloading files, the speed of the screen is irrelevant since the data
goes straight into a memory buffer and then onto disk.

>> The software is straightforward. The hard part would be wiring up the UART to
>> the parallel bus.
>
>Do you really think so?

Yes. Perhaps it would be harder for someone who has not already
implemented many such interrupt handlers before, but for ME the software
would be by far the easier task.

2530. 8-bits left abandoned

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-01 18:31:04 UTC
From: ahansfor@parrot.wpi.edu
Message-ID: <AHANSFOR.92Jul1133104@parrot.wpi.edu>
Source record: 110580

The decision not to continue with upgraded compatibles was forced upon the computer manufacturers (Atari,Commodore, Apple) by the microprocessor suppliers.

When the 8-bit uP's were developed, very little thought went into an extensable architecture. Hence the 8-bit processors were abandoned. This is true of the 6502, 6800/6809, and the 8080/8085/Z80.

Now the 68000 was designed as a thirty-two bit micro and was easy to extend to the 020, 030, 040. The 8086 was designed as a 16 bit micro and has been moved into the 32 bit areana.

It may be possible a processor that could process 8-bit instructions correctly and still have an extended and extensable architecture, but it would be a mess.

The 8-bits (800 c-64 and Apple \\ ) were doomed to be dead ends from the start.

2532. comp.sys.atari.8bit Frequently-Asked Questions

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-01 19:10:00 UTC
From: CURRENTM@CARLETON.EDU
Message-ID: <01GLV60DN6EO90MZ3G@carleton.edu>
Source record: 110576

Frequently-Asked Questions

comp.sys.atari.8bit

Revised 24-Jun-92

additions/corrections/comments to Michael Current (currentm@carleton.edu)

What is comp.sys.atari.8bit?
comp.sys.atari.8bit is the Usenet newsgroup dedicated to the free exchange of information pertaining to the 8-bit Atari computers: the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, and the XE Game System. Users of Atari TT, STe, or ST computers refer to comp.sys.atari.st. Users of Atari Portfolio computers refer to comp.sys.palmtops. Users of Atari Lynx, 7800, 2600, or 5200 game systems see rec.games.video.

What is the Info-Atari8 Digest?
The Info-Atari8 Digest consists of postings to comp.sys.atari.8bit, collected and e-mailed to subscribers on the Internet who do not have access to Usenet. To subscribe or unsubscribe to the Info-Atari8 Digest, send e-mail to Info-Atari8-Request@naucse.cse.nau.edu. PLEASE, do NOT send subscription requests to Info-Atari8@..., but to Info-Atari8-Request@... Such a request sent to Info-Atari8@... will be sent to the hundreds of subscribers of the Digest, and probably won't be seen by the moderator whom you're trying to reach.
Cross-posting from the Info-Atari8 Digest to comp.sys.atari.8bit is not implemented at this time. Thus, one should NOT post to Info-Atari8@naucse.cse.nau.edu. Rather, one should send his/her posting to comp-sys-atari-8bit@ucbvax.berkeley.edu to ensure that the message will appear on comp.sys.atari.8bit.

What is the atari.archive?
atari.archive.umich.edu is the Internet site which contains many files for the 8-bit Atari computers. The 8-bit Atari Archive Moderator is John Dunning, jrd@stony-brook.scrc.symbolics.com.

How do I download files from the archive?
Two methods:
1. If you have FTP access you can FTP to atari.archive.umich.edu (141.211.164.8), login as "anonymous" and type in your e-mail address as your password. Now type "cd atari/8bit" to reach the 8-bit directories. If this is your first visit to the archive, be sure to download the file -read-.-me-. Other files of interest are 8-bit.cat, containing 1-line descriptions of all the files available, and 8-bit.text, which contains paragaph-long descriptions. Be sure to have file-type set to BINARY when downloading binary files (.arc, .com, etc.)

2. Send mail to BART, the atari.archive file-server. BART's address is atari@atari.archive.umich.edu. If you are a first-time BART user, send it a message that says:

help
send 8bit/-read-.-me-
send 8bit/Index

BART automatically UUEncodes binary files before sending them to you. Other files of interest are 8-bit.cat, containing 1-line descriptions of all the files available, and 8-bit.text, which contains paragaph-long descriptions.

How do I upload files to the archive?
Three methods:
1. FTP to atari.archive.umich.edu (141.211.164.8), login as "anonymous", type in your e-mail address as your password, and then type "cd atari/8bit/new". You may upload files to this directory. Be sure to set file-type to BINARY if uploading a binary file (.arc, .com, etc.) Also, please upload a short .text file describing your upload so John Dunning can tell what permanent directory to move it to.
2. Send your upload by e-mail to jrd@stony-brook.scrc.symbolics.com. If you're sending a binary file you must UUEncode the file first. Be sure to include a short descrption of the file at the top of the message so he knows what directory to place it in at the archive.
3. If you can neither FTP to the archive nor e-mail to John Dunning, then you are welcome to post your file, UUEncoded if binary, directly to comp.sys.atari.8bit. You'll then be relying on someone else to take your posting and upload it to the archive for you.

What is Z*Magazine?
Z*Magazine ("Z*Mag") is the International Atari 8-Bit Magazine, published bi-weekly. It covers the 8-bit Atari computers exclusively.
To have Z*Mag delivered "right to your own mail box," send a message to Ryan 'Gozar' Collins at rlcollins@miavx1.acs.muohio.edu, asking him to add your address to his Z*Magazine Distribution List. Back issues of Z*Mag are available at the atari.archive in the /atari/8bit/zmag directory, in filenames such as zmag204.arc.
To reach the publishers of Z*Magazine, contact Ron Kovacs at 75300.1642@compuserve.com, or Jon Clarke at jonc@status.gen.nz.

What are the News-Disks?
The Atari 8-bit News-Disk ("News-Disk") is an on-disk Atari 8-bit only magazine from the UK. It is sent on-disk to subscribers in the UK, but is also made availble to people with email or FTP access. Each issue is supplied in ARC format. They are not in straight text format like Z*Mag. Each issue contains articles on various aspects of the Atari, along with programs in Basic, Turbo-Basic, and M/C. Some issues also contain .PIC files (viewers always included), speech files, and some others. Every issue contains a copy of XR_40 for viewing text files on the screen, and a copy of a simple program to print articles. Alternatively, you can read/print from any word processor. Each issue should be unARCed onto a single density disk with a copy of DOS 2.5 DOS.SYS on.

All issues are at the atari.archive. They are accessed by
'/atari/8bit/djg/issueX.arc' where X is the number of the issue desired.
To submit articles, mail djg0@aber.ac.uk.

What is the Cleveland Free-Net Atari SIG?
The Cleveland Free-Net Atari SIG is like a huge public bulletin board system. Anyone can access the Free-Net via modem at (216) 368-3888. Those persons with full Internet access can TELNET (this does not mean FTP) to freenet-in-{a,b,c}.cwru.edu (129.22.8.{82,75,76}). Applications for accounts are handled online. Once logged-in, type "go atari" to reach the Atari SIG. Those who add their names to the Atari SIG members-list are automatically members of the official Atari users' group CAIN - Central Atari Information Network.
CAIN carries Z*Magazine and the Info-Atari8 Digest, as well as many product reviews and all sorts of other information related to Atari products, all online. Its mission for 8-bit users is as a depository for any and all information in ASCII format related to the 8-bit Atari computers.

What product developers or vendors support the 8-bit Atari?
Ray Wilmott maintains a list of current 8-bit Atari vendors and developers which is too long to include here. Contact him at wilmott@remus.rutgers.edu

What is an .arc file?
A file with the extender .arc has been archived, in a standard manner that is common in the IBM-PC/MS-DOS world. This is done to make the file shorter, so it takes less time to transfer between computers. The atari.archive contains an un-arc'er called supunarc.com for the 8-bit Atari. The companion program is called superarc.arc (use supunarc.com to un-arc it). Each is compatible with the MS-DOS equivalent.

What's this UUEncoding stuff all about?
UUEncode/UUdecode is a UNIX utility that will convert a binary file into 100% printable ASCII characters, so that the file may be posted or e-mailed anywhere a text message can go. The 8-bit Atari is perfectly capable of UUEncoding/UUdecoding as well. The file uudecode.bas (the documention file is uudecode.doc) is at the atari.archive. It's in Atari BASIC text format (ENTER it into Atari BASIC). The file yau.arc contains yau.com, a machine-language UUdecoder, and yaue.com, a UUEncoder for the 8-bit Atari. Each is compatible with the UNIX equivalent. UUEncoded files are given the extension .uue.

Can I read/write 8-bit Atari disks on an IBM-PC?
There are no fewer than 5 programs at the atari.archive that claim to achieve this, at least to some extent. They are:
pcxfer.arc - Predecessor of all but sr.arc. No recent usage reports.
util.arc - Perhaps the most widely used; archaic instructions, but works.
dskutil.arc - Reputed to be a cleaned-up util.arc.
atario21.arc - Also an improved util.arc, but only read, no write.
sr.arc - Stands for Sparta Read, for SpartaDOS format disks.
Each of these programs runs on an MS-DOS type of computer. For disks written on your PC to be read on your 8-bit Atari, you must have an Atari disk drive capable of accessing at least 180K, SS/DD disks. That is, an XF551, Indus GT or equivalents, but not an unmodified 1050 or 810. There is no way to write 128K or 90K Atari-format disks with an IBM-PC. You will also need either SpartaDOS or MYDOS on the Atari.

What's the best DOS for the Atari?
This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system. MYDOS is an extension of Atari DOS 2.0S/2.5 that provides subdirectory and hard-drive support. SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2D is disk-based; SpartaDOS X is cartridge-based and includes many additional features. While it's hard to argue that SpartaDOS X is not the most advanced DOS available, it is a commercial product that is no longer manufactured. MYDOS, on the other hand, is a shareware product that continues to be improved upon. It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. MYDOS is available at the atari.archive.

What are the best telecommunications programs available for the 8-bit Atari?
It all depends on what type of computer you intend to connect to. For connecting to Bulletin Board Systems, BobTerm is the unchallenged favorite. For connecting to larger computers, you will need a VT100 emulator. Several

are available for the 8-bit Atari, each with its own advantages. Kermit-65 is a VT100 emulator, provides Kermit file transfer and an 80-column screen display, but does not support the XEP80. VT850 is a VT100 emulator that supports the XEP80 but provides no file-transfer. OmniCom is a VT100 emulator providing both kermit and xmodem file transfers, plus an 80-column display, but does not support the XEP80. Each of these programs is known to work with the SX212 Modem connected to the SIO port, and to work under SpartaDOS and MYDOS; each program is available at the atari.archive.

Hate to tell this to you, but Omnicom does that Ctrl^s and Ctrl^q trick,
and it does NOT work, at least not with any of my unix accounts, or even on
the Cleveland.Freenet system at 2400. It sends the ctrl^s but the other
machines just keep on chugging away at spewing data out.

>Yes. Perhaps it would be harder for someone who has not already
>implemented many such interrupt handlers before, but for ME the software
>would be by far the easier task.

Nah, they are both simple. The hard part is corisponding the software
to the hardware. You must know how you're going to be doing things in
both the software and hardware before you start anything, or else youll
end up with dead ends.

>And now for a totally philosophical question:
>Why didn't Atari make the ST's compatible with the 8-bits?

Because there's a huge difference between going with successive processors from the same company, in an evolutionary (although I don't think that applies to IMBs!) fashion, and jumping from a 6502 to an MC68000. That's roughly equivalent to going from an 8086 straight to an 80286, only worse, because they weren't made by the same manufacturer.

>The new ST's COULD have been made compatible.

Sure... at the expense of everything that makes an ST worth having.

>There could have been a faster CPU with more commands, better features,
>more memory access abilities, multi-tasking etc, but STILL be able to
>use old 8-bit software.

So you think the DataQue 8/16 chip/board (basically a souped-up 6502) is equivalent to an MC68000 w/MMU & custom hardware? Think again.

>I mean, look at IBM!! They made their computers totally compatible,
>from the earliest 64K 8088's till today's 50Mhz 486.. How was THAT done,

Bwahahahahahahahahahahahahahaha <hack> <choke> <gag!!> If IBM is so great, go out and get one! That backwards-combatability [sic] is one of the main things that's wrong with IBM computers! And you would wish that travesty on ATARI??!! :^)

>and why didn't Atari (or Apple or Commodore, but we don't care.. :))
>do the same?? Atari could have been the largest computer company in the
>world by now!!!!!

Not a chance. They were never a marketing giant like IBM, which is the biggest part of the game. Don't overlook that. Think about it: If IBM can push enough inferior hardware to be selling more personal computers than anyone else, while ATARI manufactures superior hardware but can't advertise it well enough, doesn't that imply that marketing is far more important in actual sales than product quality?

>Anyone think differently? Comments? Send 'em on to the newsgroup.
>I'd love to hear comments on this interesting (for me at least) issue.
>Or has it been raised before?? I'm new on this net..

>Bye!! -Itay

You asked for comments, you got 'em! :^)

Hello,

Is the terminal program that "came with Omniview" OmniCom? I have used
OmniCom for over 5 years, even with 2400bps to a modem (and 9600 bps to
a null modem, linked to my TT). The key to getting > 1200bps is to select
Custom when setting the Options (instead of 300 or 1200 for speed), and then
enter the proper numbers. At least this works with the 850 interface; I'm
not sure about the P:R: or others. (OmniCom comes as a program without
interface driver - you append [COPY with /A] the OC program to the RS232
handler program to get the OC.OBJ, or OC.COM if your DOS supports .COM files.)
For the 850 interface, to run at 2400bps, the Custom numbers that work for me
are (these are Hex): 0C, 00, C1. For 9600bps (used in my case for file xfer
only, over null modem; OmniCom cannot even hope to keep up with continous
screen output at 9600bps), substitute 0E for the 0C.

If you ever hear of a way to use BobTerm with OmniView (I haven't),
I would sure like to know about it! (I don't use my 8-bit for a terminal
much anymore, except to xfer files to/from my TT, but - having never been
spoiled by BobTerm since I was too cheap to buy an XEP-80 after having Omni-
View, I really like OmniCom.)

Nick DiMasi nickd@vpnet.chi.il.us

2536. Atari 8-bit goodies for sale

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-01 22:07:49 UTC
From: clf3678@ultb.isc.rit.edu
Message-ID: <1992Jul1.220749.11145@ultb.isc.rit.edu>
Source record: 110586
Cross-posted to: comp.sys.atari.8bit,misc.forsale.computers

The following goodies are for sale.

Prices do not include shipping. Will make a deal on multiple purchase of items, but prices are pretty low. Everything listed here is in PERFECT working condition! I'll find out the EXACT UPS shipping charges for anything you want to order.

Hardware

Atari 800 computer. 48K, BASIC cart. Perfect condition. An oldie, but a great machine. Includes power supply and dust cover. $25.

Atari 1050 disk drive. Stock drive. Includes power supply, owner's manual. $75

Atari 810 disk drive with 810 Archiver installed. $50

Atari 850 interface. Includes power supply and printer cable. What else needs to be said about it? $50

Atari XE Game System. Only 6 months old! Includes all manuals, light gun, joystick, and Barnyard Blaster cartridge (not the Bug Hunt cart that usually came with them), and a few other carts. Power supply is also included. MINT condition! $75

NEC PC-8023A printer. It's a simple, 100cps dot matrix printer. Uses the same ribbon as the Apple ImageWriter II, so they are easy to find. In GREAT shape. Includes dust cover and user manual. $50.

I will also consider trading Macintosh goodies for this stuff. Please reply via one of the below methods if interested.

____
	Chris Freemesser, RIT Comp.Eng.Tech. I'd rather have a bottle

2537. Atari 850 interface questions

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-01 23:05:12 UTC
From: jem@hpcupt3.cup.hp.com
Message-ID: <105620001@hpcupt3.cup.hp.com>
Source record: 110602

I am curious about the Atari 850 interface.

* How many ports does it have? What types of ports?

* What baud rates are allowed on the serial ports?

* Can the 850 redirect serial I/O from one port to another
without sending the bits into the Atari 400/800 to which
it is attached?

* Does the 850 have any internal buffering? Can serial
ports running at different baud rates intercommunicate?

* Is the 850 programmable? Can it be controlled by a
computer other than an Atari 400/800?

Please e-mail your reply; I don't usually check in here. I will post
a summary if there is interest.

The funny thing is that the IBM PC was a real heap when it was
first released. BASIC XL could outrun IBM's BASICA by a good
margin. A graphics card was optional and the best you could do
was something which wasn't even up to the quality of the Apple II.
Four colors--period. A cheesy speaker for sound. No ports
of any kind unless you bought a card (not counting the
cassette port). Development tools which weren't on par
with MAC/65 or Action! All this for what, $2500? Amazing
that it caught on...

Source record: 110585

So far this year I've acquired a couple 600XL's & am fascinated by the possibilities of the 600XL's small "footprint". Both of my machines have 64K upgrades, but I'm addicted to RAMBO on my 800XLs & was wondering if it's possible to install 256K into a 600XL.

Seems like it should be possible. Upgrading from 16K to 64K requires a few wires & 2 4464 DRAMs. I saw 44256K DRAMs in the Pooter Shopper for $6 or so & got to wondering....

Anybody????

>and why didn't Atari (or Apple or Commodore, but we don't care.. :))
>do the same?? Atari could have been the largest computer company in the
>world by now!!!!!

Maybe the largest game company, instead of Nintendo. But the difference between the 6502 and 68000 vs. 8088 and 486 is that the 486 executes the exact same instructions as the 8088, thus remaining 100% compatible. The 486 has NEW instructions to allow you to make use of the 32-bit architecture. The 6502 and 68000 on the other hand, which aren't even made by the same company, use totally different instructions. If a 6502 wants to read a byte of memory, it uses one instruction, while the 68000 uses a different instruction. Thus the incompatibility. The only way to get around is it to write an emulator like ST Xformer that translates from the 6502 instruction to the 68000 instruction. In the process you spend a lot of time translating, and you end up with a slower emulator. But emulation gives you the advantage of making any computer compatible with any other computer, at the expense of speed.

The only way Atari could have made the ST compatible would have been to have some chip maker come up with a 32-bit upwardly compatible version of the 6502. There was a 16-bit version of the 6502 used in the IIGS, but that's as far as it got. Intel's solution is actually quite nice. When the 486 first powers up, it behaves exactly (well, almost exactly) like an 8088. It's in effect, a 50Mhz 8-bit 8088. Only after you give it special 486 specific instructions does it then turn into the 32-bit beast it is.

>

Motorola is still selling descendents of the 6800/6809. The MC68HC11 is a very complete computer on a single chip used in embedded controllers and single board computers. It has on board RAM, ROM, EEPROM, two serial ports and an eight channel 8 bit digital to analog port. New Micros Inc. sells a version with Forth in the ROM. The latest version (the MC68HC16) even has built-in DSP functions.

From: etxansk@garbo.ericsson.se
Message-ID: <etxansk.710065761@garbod20>
Source record: 110589

Synapse Software released the game Zeppelin in 1983 (I think it was '83). It was written by William Mataga, and I can remember I was impressed by the graphics.

I found this game on a disk recently, haven't played it for years. But now I've noticed the difficulty increases quite a bit when I get to level 2.

How many levels are there in Zeppelin? Does anyone know of an underground version with cheats (level select?) or anything that lets me investigate the game? I've always been interested in modifying assembler code in games, but this game's so old and I don't want to re-invent the wheel.

Please email me if you've got some hints on this.

Anyone remember those spiffy glitches in almost EVERY 2600 game? THe most noticable are the sprite shadows or something on the left edge of the screen. A memorable one is in Soccer (or Pele's Soccer, I guess it was officially called. I've got the Sears version of it). They used the little black lines and blocks that appear at the left of the screen at the same height as the players as "referee's". It was just an excuse for them... or maybe they were used as an advantage to get some extra "realism" or something!? Anyways... in a bunch of games you can't see them. (like Space Invaders) unless the screen artifacts. I'm just wondering what they were, and HOW the 2600 got all the players on the screen. Was it done the same as ont the 8-bits?
thanx. happy 2600ing! :)

2550. Parrot/ComputerEyes

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-02 10:17:05 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <7350mB13w164w@cyberden.uucp>
Source record: 110596

You don't know how little space an ehanced denisty disk has until you get these two little gems. Fun fun fun. I've already almost finished up two projects for use with ComputerEyes. One is called Frame Maker. (note: both of these are in TurboBASIC) It collects a bunch of frames of images for being shown in sequence. Since, of course, you can only have 3 or 4 (at most) full-sized frames in MEMORY, what this program does is convert them to however small you want them (right now, it's set to a max of 1/25 (you select between 1 and 5 and it will cut the X and Y sizes by that much) and you can also set decimal numbers, like 2.5 or 2.75 or 1.25 or whatever). Then the files are finished, you load them up (with a not yet made generic loader) and they will be played in sequence. This program will probably come out after the next one. (Btw: yes, I've made a digitized video animation.. 21 frames from a video of a friend done on a camcorder) The other program is a colorizer. It sprouted from a long line of programs. The first of which, I'm going to guess, was APACView, by Jeff Potter. This allows for 256 colors on the screen at once, by doing some nifty DLI tricks to a GRAPHICS 9 screen. From there, somebody made a BASIC program to load the 80 x 96 x 256 images. From THERE, I made a small TurboBASIC XL LISTing that adds a few EXECuted PROCedures for turning on APAC mode. It's only disadvantage was the inability to use any of the regular commands like DRAWTO and CIRCLE and whatnot. Instead, I made some routines to copy a buffered screen onto the APAC screen. This was slow and tedious. I finally took the time to redesign the entire Display List. Now PLOTing and DRAWTOing on the top half of the screen affects the screens colors while doing things to the bottom half affects its brightnesses. As well as being faster, this is much easier to use. Anyways.... from THAT (APACSET2.LST, I'll get it up to the archive ONE day...or get somebody to do it for me!) I created "COLORIZE.TBS". It's a program that allows you to paint color onto a black and white image. (like those made with ComputerEyes) If, say, the person had blue eyes, you'd move the cursor to the eyes, outline them blue, then fill them. At first, it all looks really strange and unrealistic, especially if you have the color's luminance high, which makes it blend less with the brightness part of the picture. But once you have more of the entire picture colored, and the luminance down, it looks almost real. (if you colored somebody's hair, it'd look strange until you colored them in, as well as the background, etc.etc.) I've only made one example, and cannot upload it (due to the fact that the subject would rip my face off!), but I will eventually both animate and colorize some things for uploading. Perhaps one day they may become parts of nice demos. like those coming from Europe!? ... I need a bettwe language than TurboBASIC Xl for that, though! :)

The Kermit65 program from the atari archive simulates 80 columns using Antic
mode F, but its scrolling is slow enough to indicate that it does not use
any of the optimizations that Toms mentioned. Last month I ftp'ed the
source and was about to optimize the scrolling, but it just dawned on me
that someone else may have already done that. So, open question, has
anyone optimized the scrolling routines in Kermit65? Or any other
improvements?

Why don't I? Space. If I kept EVERY old machine I've ever owned, there wouldn't be enough room in my house to store them all, much less keep them all set up and ready to use in case I need to run an older software package.

>Is it illegal where you live
>to own 2 computers at one time? You make it sound like you HAVE to throw
>away your old machine the instant you buy a better one.

See above. It's not a law of man, it is a law of nature: when your available desk space fills up, the law requires that one of the machines must give. If you're unable to run your old software on your new machine, looks like you're SOL. I, on the other hand, get along just fine since my new machine is backwards compatible with my old.

Bear in mind that the vast majority of computer users are not hobbyist hackers like you and I. They are business people, and they use their computers as tools to get their work done. Once every year or so they upgrade because new machines can do their work faster and better. I'm sure you're also aware that software development lags far far behind hardware development. The '386 came out YEARS before any software ook advantage of it. Because the '386 machines were backwards compatible, people could upgrade right away and see immediate benefits. If they had to live by your philosophy, they'd have a useless machine taking up space until someone got around to developing software for it.

Think about it - if BUYERS didn't DEMAND backwards compatibility in computers, do you think Intel, Motorola, or the various PC makers would BOTHER with the compatibility? It's so much easier to just whip up a new design for an advanced microprocessor from scratch with no constraints of compatibility, it would cost the chipmakers less to design and debug. They'd LOVE to do it that way, but nobody would buy them. Even high tech

RISC and SPARC chips need compatibility in order to sell (they all run UNIX, so people can port their UNIX apps to new machines).

>Thanks You For Playing.

No, thanks[sic.] YOU! It's been a pleasure.

Obviously the other machine needs to be set up to handle any sort of handshaking you decide to implement. This problem exists at ANY speed, BTW - not just at 19.2Kbps. And it would be true of any computer you chose to connect with these Unix accounts, not just an Atari.

In short, the problem you describe is not a flaw in the IDEA of communicating at 19.2Kbps, but rather a flaw in the configuration of the two machines communicating. It's like you set your PC to operate at 8 bits no parity, but the remote Unix box was set for 7-E-1; this is not the fault of the R: handler or the serial port, this is a configuration problem. Once you set up the Unix accounts to stop the flow upon receipt of ^S and start it again after a ^Q, you're all set (and YES, it can be done).

So you are saying that you have had several machines (even if
you have one of the smallest houses in the world it could probably
store several machines). Are you saying that all those machines have
been backwards compatible? If so, you are probably an IBM clone user
(there has not been a housful of new versions of the 8-bit (not that
there needed to be (like the IBM did) but that's another story ;-)).
If you are a PC user what are you doing on this group? Maybe you are
trying to get more people to move to the PC and contribute to its
monopolistic dominance?

Also, you don't have to keep EVERY old machine unless you still
need to run all that old software. I can't see a person needing to run
software on uncompatible systems more than 2 levels deep. (Look again
at how I evolved from the 800XL to the STe in a previous post. I planned
on keeping it forever when I first got my STe but after a little less
than a year I noticed that I hadn't turned the 800 on (even though it was
still completely setup and ready to go right next to the STe)).

I know it can be done, it is configured that way! It works at 1200 baud,
but at 2400 it just doesn't cut it. And its not just these two machines,
I connect to unix's at KSU, CSU, CASE, and a few other places, and it does not
work. I do know what I'm talking about and it doesn't work.

Hi,
in ATARI.FAQ, there is one Q/A about reading Atari disks on PC. There's written, that it isn't possible with 1050 disk unit. But it is. There is program MLOK & HROCH, which enable it.
MLOK writes one file (<32K, I think) to a diskette, formatted by Dos 2.5 on 1050 unit. This file is written in some special way, so it can be read by HROCH on PC.
I cannot uplode this file anywhere, because it's sold by Atari Club Prag (Czechoslovakia).

Then I guess I am the one who doesn't know what you are talking about.

You say your comm program sends ^S and ^Q characters to start and stop the flow, and it works with a given system at 1200bps. Yet, you further claim that at 2400bps, the same comm program sends ^S and ^Q characters, yet it "just doesn't cut it." I guess I need to know what you mean by "just doesn't cut it" before I can understand what you're trying to say here.

If it works at 1200bps, I can see no logical reason why it should suddenly fail to work at 2400bps. Are there other variables at work here that you haven't mentioned? In any case, your experience with one particular comm program does not automatically condemn all other comm programs, present and future. Just because one specific implementation does not work at higher speeds does not prove that NONE will work. The fact that the Atari disk drives send data over the serial bus at 19.2Kbps and above proves that the hardware is capable of operating at that speed. All it would take to get an RS232 serial port to operate at the same speeds is the right design.

I was a long time Atari 8-bit user until about a year ago - and I keep some of my ties to my old user group (now 400 miles away). At one point I had the hottest system in town - 320XE, 1megMIO, 20meg hard drive, XF551 drive, 1200XL function keys, hard wired 10key pad, SpartaDOS X, an 800 with USD 1050, and bunches of other stuff - when I packed it all up to sell it made a 4X4X3 stack. I was a hard core user and programmer - right down to the machine language level - but I rarely used my system for games. If you have any questions, or just want to chat, leave a message.

.
.
.
>The only way Atari could have made the ST compatible would have been to
>have some chip maker come up with a 32-bit upwardly compatible version of
>the 6502. There was a 16-bit version of the 6502 used in the IIGS, but
>that's as far as it got. Intel's solution is actually quite nice. When
>the 486 first powers up, it behaves exactly (well, almost exactly) like
>an 8088. It's in effect, a 50Mhz 8-bit 8088. Only after you give it special
>486 specific instructions does it then turn into the 32-bit beast it is.

Well, actually, your simplified description of the 486 sounds
very much like how the 65816 acts. In emulation mode, an
8 mhz 65816 would be acting like an 8mHz 6502, only when set into
native mode does the 65816 take on the capability of having
16 bit registers, 24 bit addressing, etc. It also supports
separate program and data banks, as well as some capability
for an MMU to enhance this feature. The 65816 also has a Vector Pull
output for prioritizing interrupts, and a COP instruction which
in combination with the vector pull would allow some sort of external
coprocessor support.

Not to say that the 65816 approaches the sophistication of the
486 or 68030 microprocessors, it is still externally an 8 bit
CPU, with only the three registers, X, Y, and A, and only
a limited number of opcodes. But I don't believe its lesser
capabilities should be equated with its being incapable.

If you ask me if I think Atari's going to the 68000 was wrong, I
don't think so. If the amount of development that went into
the 8086 through 80486 lines, and the 68000 through 68040's had
been put into a 6502 successor, I think it would have been viable,
I think I read somewhere that an immense amount of the work done on
the 486 was to make it backward compatible, and it is conceivable the
same type of thing could have/could BE done with the 65xxx.

Western Design Center, being a modest company, has made modest,
but in my opinion excellent improvements to the 65xxx line, but not
something I feel compares with the 040 and 486 chips.
>
And yet, I can't help but wonder what fun it would be to own
a 30mHz Atari 8 bit

Oh, and by the way, Western Design is working on a 32 bit 6502, called
the 65832. I was hoping it would have some built in floating point
support, as hinted at in the 65816 specs, but seeing a preliminary
specs on the 65832, it's nothing but a 65816 with 32 bit regs, nothing
else....

Did someone say the Super Nintendo uses the 65816? Interesting,
as I waswondering why WDM would be developing further 65xxx chips
these days, now I know why.

All this talk about 80 column being too slow brings me to wonder why
nobody's every tried one of my old ideas (tho you'll loose good inverse
capability, but since most BBSes are ASCII, THEY can't do it anyways).
All it is is a character set identical to that used in the GRAPHICS 8
mode 80 column emulation. From there you just have two 960-byte
displays. One is of the left nybbles (if the two screens were truly one)
and the other is of the right. When flipped back and forth, as well as
scrolled 2 color clocks (or even just by having two character sets, one
left, one right, then flipping location 756 between the two), you have a
(probably somewhat flickery, but none the worse for wear) 40 column speed
80 column screen. Still not the greatest LOOKING text, but at least it
will allow people to bust the 2400 baud 80 column boundary. Applications
like ANSITerm can't use this idea because it needs the ability to print
out all of the graphics characters and then some (I think), so it needs
a graphics screen. But.... anyways.. anyone up to this little idea??
Just remember.. the screen display would be recorded like this (imagining
that the "L"s are together on one 960 byte block, and the "R"s are
together on another):
LRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLR
LRLRLR
LRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLR
LRLRLR
LRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLR
LRLRLR
LRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLRLR
LRLRLR
etc.
(I guess this place can only handle 74 column messages??)
you get the idea. Hell.. maybe I'll work on one in Pascal or when I get
quick. It won't be BobTerm, but it'll work! (with any luck! :))
adios

I'm afraid I have been out of it relative to Atari 8bits lately, though
I used to be rather heavily into them. Right now my dead Atari equipment
consists of a 400, 800XL w/256K, 130XE w/Turbo-816. I think my US Doubled
1050 and 1 Meg MIO still work. Right now all I have is an HP2621P terminal.
Has there been any word lately on DataQue's newer projects? They were
either going to build a 130XE card for a PC or an 8Mhz 65816 machine with
a PC bus/case. Does anyone know what came of these projects? I would be
interested in the later as a hacker's machine. Thanx.

True. Yet these are not used in any new personal computers. The
controller market that for which these are intended in many cases do
not need the extended architecture of a general purpose register
machine. The 8-bit processors can be improved and expanded. It's
just difficult to push them into the areas where they are useful to
general computing applications today.

Message-ID: <13186@mindlink.bc.ca>
Source record: 110661

> Jim McCauley writes:
>
> I am curious about the Atari 850 interface.

I no longer have any 850 manuals, so these answers will be from memory. Take it as you will.

> * How many ports does it have? What types of ports?

Four serial ports, one parallel port. The serial ports aren't implemented with UARTs, believe it or not! Atari used a pair of VIA's instead. It's just a fancy sort of bit-banging. Very primitive. The little 6507 has a lot of work to do.

Port #1 is a full-featured RS-232 port. Ports #2 and #3 lack some handshake lines. Port #4 is equivalent to #2 and #3, but set up for 20ma current loops. All the serial ports use DE-9 connectors. There is also a Centronics-compatible printer port, using a DC-15 connector.

> * What baud rates are allowed on the serial ports?

110 bps up to 9600 bps.

> * Can the 850 redirect serial I/O from one port to another
> without sending the bits into the Atari 400/800 to which
> it is attached?

Nope. It's not that smart. In fact (and this came as a suprise to me) you can't run more than one port concurrently!

> * Does the 850 have any internal buffering? Can serial
> ports running at different baud rates intercommunicate?

Very little buffering. I think there's a RIOT chip in there... that would mean 256 bytes of RAM for stack, workspace and buffers. Consider it unbuffered. Ports cannot intercommunicate, as I said above.

> * Is the 850 programmable? Can it be controlled by a
> computer other than an Atari 400/800?

It isn't really programmable. I suppose it's possible for any computer to talk to an 850, but it would have to emulate the SIO protocol. That's 19.2kbps clocked synchronous with handshaking.

It's a shame. There was so much potential there! But I guess at the time, Atari didn't see the need to make the 850 smart, and they wanted to keep costs down to a minimum.

It's probably buffer overflow, Khan. The default recieve buffers for an R: device are pretty small... 128 bytes? And we all know that large multiuser systems can be very slow to respond to XON/XOFF handshaking. If the ^S is sent 16 bytes from the end of the buffer, at 2400 bps or faster the odds are the buffer will be overrun anyways.

Enlarging the R: recieve buffer (there's an XIO for that, isn't there?) and setting up your own XON/XOFF handler (R: doesn't support it internally) with a reasonable threshold (say, 2k buffer, threshold at 1k) should work a lot better.

If you're building UART hardware, these fixes would go into your custom R: handler so the terminal program doesn't need to know about it. Then we come to a new problem... binary file transfers. The handshaking must be disabled for file transfers, or at the very least a protocol used that escapes XON/XOFF sequences (like Zmodem or Kermit). Existing terminal programs wouldn't know how to tell your handler to enable/disable handshake, so it's a real limitation. If you can't live with just Kermit (and I can't.. ug) then add a new terminal program to the list of things you need to write.

2568. Faster modem needed

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-03 17:33:38 UTC
From: garrick@acsu.buffalo.edu
Message-ID: <Bqtq43.ALF@acsu.buffalo.edu>
Source record: 110663

I recently unpacked my 130xe and decided to rejoin the 8-bit computing world. I have a few questions:
1. I have a 300 baud xm301 modem and pro-term software. I would like to get a faster modem (2400 or 9600). Can someone tell me where I can get all the software and hardware I need. I dont have an 850 interface.
2. How can I get software from the archives. What hardware do I need?
3. Are there any 8-bit user-groups in Western NY.
e-mail or posts is greatly appreciated.
Thanks in advance

garrick@acsu.buffalo.edu

The board here has been down for a little while so I may not have gotten some messages. Someone said awhile back they had a percom. I posted something back but didnt here from the person yet.
To person:
If you get this message, reply or send mail. Im still very interested in buying the disk drive if its double density. otherwise reply anyways to let me know.

From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <61497@cup.portal.com>
Source record: 110665

Well, I dropped oout of this for a while & missed a lot, but if anybody is still listening <g>. Look!#$@* an ST can not keep up at 19,200 baud for the same reason. It can't scroll 32000 bytes fast enough. Everyone has there own definition of what 19,200 means. IMHO it is being able to keep up with a "CAPTURE" with the data being displayed or at the very least display the data that's comming in W/O "CAPTURE". It may be an academic question, but I've seen info that says regular phone lines will do about that. Like I said, my worst routines will not go beyond 1,200 baud & my hotter ones look like they will do 2,400. FYI: All I'm doing now is moving the screen display down & clearing 320 bytes above it. I use page zero, y addressing & move a full 7680(?) bytes. The blank 320 bytes means I don't scroll cartridge or OS data onto the screen or have to zero 320 bytes every scroll. I haven't got the energy to write a entire Dl of DLI's, but whoever suggested it is probably right. What I may try is a single increment of Y for the loop to cover everything, something like:

```
LDY #0
LDA $8000,Y
STA $8000+320,Y
LDA $8000+40,Y
STA $8000+320+40,Y
ETC. ETC.
to the INY
BNE MOVE
```

BUT 19,200! sheesh! W/O counting processor cycles, let's say 1/3 of the time, the screen is being displayed. Further, this means a single scan line takes about 1/200th of that or (1 sec)*(.3)/(200) or 1.5 ms. Now at 19200 let's assume we've got a start bit, stop bit & 8 bit data word, this means youd get 1920 characters/sec. This works out to 1 character/.52 ms! In other words, unless you had one of those 16550 chips with built in buffers, the 6502 (or anyother processor for that matter that gets cut off during the screen display) will not make it! It just lost 2 characters while waiting for the current scan line to complete so it can service the interupt! It doesn't have anything to with the computing power of the microprocessor. A 68040 @ 40 mHz would have the same problem. It could be done, but it would require a seperate processor that could respond to the interupt W/O being shut down by the screen display, it's own buffer ram, etc.

1200 baud => trivial
2400 baud => you'd better know what you're doing
19,200 baud => I'd like to shake that persons hand!

Well, I've ranted enough. I'll get back to my bare bones 80 column term program & send off the SOURCE code with it to the archive. Anybody that want's it will be welcome to look/use it. I've finished most of the other stuff that put it on the back burner. One request, I accept suggestions & help, I don't deal well with destructive critical comments.

Rick

2571. OmniCom at 2400

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-04 05:05:49 UTC
From: hill@spot.Colorado.EDU
Message-ID: <1992Jul4.050549.14765@ucsu.Colorado.EDU>
Source record: 110666

To the people running OmniCom at 2400 bps:

You're going to have to be a bit more specific about the values to enter
at the parameter configuration prompts. Here's a list of the prompts and
the values I've tried (I still haven't had any success):

<OPTION> (P)arameters
Keymap? N
Baud rate? 3 [custom]
AUX1 XIO 36? 0C [I've also tried 8C, as somebody posted]
AUX2 XIO 36? 00 [This is the default, nobody said try anything else]
AUX1 XIO 34? CO [And I tried C1 according to another post]
Parity, etc. according to comm parameters on the other end.

In case it helps, this is OmniCom dated 08/15/87. Pretty old. Maybe I just
have an old version. ??

Anyway, with all the above combinations, I can't get the modem to work.
The HS LED will come on, but typing AT<RET> produces no OK response from
the modem, as it should. Usually, after I type <RET> five or more times,
then it responds ERROR. If I try the ATDT[phone #] command, it either
doesn't go off-hook, or it does, and then types out a completely different
number (which may be in the modem's internal phone # register), and then
makes weird noises, as if I can hear it pulse dialing (even though I never
hear any noise from it during normal operations; I have the speaker off).

I know my explanation is rather lengthy, but hopefully it can be used
diagnostically by somebody who knows what's going on.

Anyway, if anyone can help me get OmniCom working with the modem at 2400,
I would be most appreciative! Thanx in advance!

2572. 19600 BAUD

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-04 05:20:59 UTC
From: Jeff McWilliams <JJMCWILL@MTUS5.BITNET>
Message-ID: <92186.002059JJMCWILL@MTUS5.BITNET>
Source record: 110667

Interesting coincidence, the ST board just happens to be talking
about high speed RS232 themselves, so I thought I'd pass along
this cross-post, as support to Rick statement about baud rate
limitations. As you see down near the bottom of the thread,
one user mentions having difficulty getting high speeds out of
an 8Mhz ST.

I agree with whoever said that for practical purposes, noone is
going to need to be reading text at 19.6 kbaud, so for me, the
idea of using the CTRL-S and CTRL-Q seems just fine to allow
the screen display to keep up with the incoming data.
With file transfers, even when I use Kermit65 at 2400 baud, things
go horribly slow, so for this, the faster the better.
And if it's a file transfer, you can disable ANTIC to get some
speed improvement, and yeah, to push the envelope maybe yoo would
need a fancy UART.

This is a very interesting and educational thread for me,
and I appreciate the opportunity to listen in on others thrashing
ideas about.

For those thinking about the Parallel Bus, I am working on
an electronic reproduction of the Antic 4 part series, among other things
so that people interested in the Hardware aspects of a high speed
homebrew RS232, or coming up with a PBI expansion standard,
can all have at least some documentation to begin with.
The schematics are proving to be the most difficult, but I am working
on a kludge for that until a REAL schematic designing tool for the
Atari 8 bit is developed. If I am wasting my time producing this,
because either everyone has access to the Antic backissues or there
simply isn't interest, please let me know. I'd like to spur these
think tank sessions along, but if I am wasting my time I'd sure like
to know.

Jeff... on with the program:

i have tried one of these hardware patches . It doesn't work unless you
have an accelerator. It works fine for uploads, but lots of CRC's and
other errors for downloads. The standard ST is simply not up to the task.

I'd like to see a turbo-board with the 65832 on it. It wouldn't be
as much sophisticaed as say sth based on a 68040 but it would be
at least easy to program in assembler since the machine language
opcodes didn't change much, did they?
How about the pri$e, is 65832 hacking very expensive?

Just dreaming......

Message-ID: <92186.143301JJMCWILL@MTUS5.BITNET>
Source record: 110669

Marek,

According to Preliminary specs, the 65832 can act just like a 6502 in emulation mode, or like a 65816, or like a 65832. It says in the docs that it is packaged in a 44 pin PLCC. No prices, as this was a preliminary set of spec sheets. The 6502 opcodes remain, and others were added. Additionally, if in native mode, obviously some will work differently.

For example, doing a STA $4000 will work differently, depending upon whether the Accumulator has been left as an 8 bit register, or set to 16, or 32 bits wide. Depending upon the register size, the full accumulator would be written to memory, thus writing to 1, 2, or 4 bytes in memory.

Message-ID: <1992Jul4.210005.6023@ucsu.Colorado.EDU>
Source record: 110674

I've called several places looking for Stationfall and Starcross. Nobody seems to have them. (One of the places said they had bought out all of Infocom's remaining stock, and they didn't have these two games any more.)

Can anybody tell me where I could buy these (unopened, original packages)?

To preface my next question, let me state at the outset that if I can find any way to buy these, I will do so. I just (finally) ordered legal copies of Planetfall and Alternate Reality this morning. I am finally in a position where I can afford to buy software regularly. HOWEVER: I really want the above two games. If there is no source where I can buy them, can anybody "slide me a copy under the door"? I would greatly appreciate it!

Anti-piracy flames cheerfully ignored (see my .sig).

My next post will be a UUencoded .ARC file (I'm STILL not sure how to get damned files to the archive!!). I suppose if you are getting onto Use/Internet with NICE software, you can skip the thing entirely. This is just a warning/description.

My T-1000 demo is a digitized animation demo of the T-1000 series terminator (that really spiffy metal one that can metamorphosize) changing from man into metal. There aren't too many frames, but they aren't squashed together, like all of my other FrameMaker files (I've gotta add some more features to this puppy, it looks like!), and the demo. itself is pretty impressive for TurboBASIC XL (;-]). Anyways, enjoy. And could SOMEBODY mail me w/ instructions on how to send to the archive. I can't get thru that FAQ because I have little/no time lately, let alone the printer paper!! (restocking time for the Billster, it looks like). Well... have fun.

>Anybody care? ;-)
>
>

You could try to keep a table of JMP/JSR/branch addresses so you at least
know where code definitely starts (unless the programmer was generating garbage
in the first place 8-)). Also, commands like RTS and JMP signal the end
of a code block, so if the next byte does not appear in the table, it could
very possibly be data. One nice option would be for the disassembler to
interpret, say, the first 20 bytes of an unknown code block to the screen
and ask the user if it wishes to continue disassembling. Of course, this
doesn't take into account the possibility the program's first instruction
is not in the first block of code.
```

Out of business, unfortunately. The rights to their games were bought by some other company, and some are being re-released (at least for some platforms) as a big bundled package called "The Lost Treasures of Infocom" or something like that.

>Anybody know where I can get such stuff as Zork I or HitchHiker's
>Guide to the Galaxy??

Well, I just happwn to have original copies of both of those games for the 8-bits. I'd be happy to trade one of them for, say, Journey to the Planets...

If you're interersted in a swap, email me.

How exactly does Hyper E: speed up the E: handler? Is this just a case
of "inefficiently designed" stuff for the 8-bit (like my 1200xl's video,
or most of the 8-bits keyboards (snicker)). It sounds cool. Is it PD?
Where can one get it?

Some knew it then. But it wasn't an issue. Some knew that the 8-bit architecture was not extensible. But with no real 16 bit microprocessors available at a reasonable price when Apple, Commodore, and Atari designed their machines processor expansion was not considered.

That was the right decision. As was moving to the 680x0 family for each of them? What's the next non-compatible jump? Power-PC? 88100? Transputer? Who knows?

No matter what you buy today, it will be obsolete (maybe usable and even fine for your needs though) in 5 years or less.

>Guide to the Galaxy??

Infocom is (unfortunately!) defunct; I believe American Techna-Vision bought out their entire stock and are now selling what they have left. You can write them at:

American Techna-Vision
15338 Inverness St.
San Leandro, CA 94579

According to recent ads they have Zork I (and about 9 others), but no Hitchhikers or Starcross or Stationfall, unfortunately. Zork I is listed at US$9.95, shipping outside the US extra (they didn't specify how much). Hope this helps.

Jeff, it was me who said the 65816 was used in the SNES. There was an article about it in one of my sons Gamer mags. I'm sure the story of the 6502 would be very interesting "IF" the truth would ever come out. For instance, I'm the reason why it's in Apples is because of the two Steves doing work for Atari so they had better access/info. It goes a little farther if you realize that the guy in Ariz(?) that designed the 65816 is the same guy who did the 6502 at MOS Technologies. I believe Rockwell even came out with a version that was essentially two 6502s in a 64 pin(?) package that could be run as two seperate 6502s or combined to operate on 16 bit data. One of the less sucessful game machines, NEC's, just used 2 6502's.
As the story goes, TI almost chapter 11'd Uncle Jack @ Commadore by not suppling him with chips for his calculator line in the early 70's. Part of his revenge was to buy MOS so he'd have his own supplier of chips. He then proceeded to drive TI out of the home computer market with the VIC-20 & C-64. I've asked Bill Wilkinson in the last week if he could shed any light on what Uncle Jack did to MOS & the 6502 designer to cause them from being one of the leading suppliers of microprocessors to an also ran with the designer feeling he had to form his own company, but he hasn't responded.
I've got nothing against any microprocessor. I like memory mapped I/O, but some of the calculator chips like the 4004/8080 etc aren't that bad either. All things be equal, I think there should've be a 50 mHz 6502 by now. I've heard the T-400 & T-800 RISC processors are derivitive of the 6502, but who knows.

2593. DiskComm File Format, Anyone?

Newsgroup: comp.sys.atari.8bit

I'm wondering if anyone out there knows the file format used by the DiskComm utility. I've downloaded version 3.2 of the program, but the included documentatioin mentions nothing about the format of *.DCM filesd. What I'd like to do is be able to copy a .DCM disk image file onto my PC and manipulate it with various tools (e.g. a disassembler). Why do it on the PC? Speed, more speed, and memory capacity. If anyone can tell me the specs on the file or knows where I can obtain said specs, I'd appreciate it very much.

Does Bob Puff have an email address somewhere? I'm sure he would know the specs on .DCM files. ;-)

Rick,

Hmm, most interesting. I knew about William D. Mensch's past because it talks about it in the Eyes and Lichty book on 65816 programming. Actually, that guy was also part of the original design team for the 6800. It says they left Motorola and joined Mos Technology and then did the 6502. What you said about the two Steves sounds about right, coupled with what Mr. Mensch says. He says MOS was able to offer the 6502 for $25.00 when Motorola and Intel were asking $375.00 for the 8080 and 6800. His mini-autobiography was signed in 1985, and he predicted that in 10 years the 65C02 would consume less than 1uA of current, and that Microprocessor cache operation would reach 100mHz. WDC is very much a family run business according to the text. His sister is Secretary and the design manager, and his wife is Treasurer. Of course, that was '85, but I suspect WDC is still a small company.

The preliminary for the 65832 said speeds up to 10mHz, I too am surprised they're not making them faster.

So Mr. Wilkinson is still around hey? What is he doing these days?

Jeff

* *
Although I have seen a couple of replies to Itay's initial message, here is probably the definitive answer on Infocom, taken from the <blush> comp.sys.ibm.pc.games FAQ file (keep in mind this applies to primarily PC's)...

14: Where can I get Infocom games? Can somebody mail me a copy (since they're out of business anyway (Is that legal?) What happened to them anyway?

A: [Thanks to Dave Lebling (Infocom co-founder) for the definitive info on this]

The Lost Treasures of Infocom is now available at Software ETC, Electronic Boutiques and other fine stores everywhere.
$59.95 list, EB price is $54.95. 20 Infocom games included - all the Zork series, HHGTTG, etc. Whatta deal - less than $3.00 a game!

Lost Treasures has (according to rumor) been successful enough that Activision (they've changed the name _back_ from Mediagenic) plans to rerelease more of the old games. Maybe they'll all be available soon.

In addition to The Lost Treasures, Activision recently released a sequel to Leather Goddesses of Phobos, written by Steve Meretzky. It's a hypercard-esque interface, not a text adventure. This was release under the Infocom label. Also under the Infocom label is a line of other non-text games (Battletech, etc).

Check out the stuff from Legend Entertainment. It's the closest thing to the old Infocom stuff around now. (Titles include Spellcasting 101 and 201, Timequest, and Frederik Pohl's Gateway).

Infocom never went out of business. It went deeply into debt to develop a database product (named Cornerstone) that was a commercial flop. It went shopping for a merger and found Activision, which later changed its name to Mediagenic. What did happen is that in May of 1989 Mediagenic closed down the "real" Infocom in Cambridge, MA, and laid (almost) everyone off. All the releases up through Zork Zero, Shogun, Journey, and Arthur were developed in Cambridge.

[Nathan Torkington writes]

Infocom were bought by Mediagenic, and are now simply a label under which games are released. The most recent Infocom releases are graphical adventures.

UK readers will be happy to learn that the games are available from Virgin Mastertronic (a budget software house in the US). I'll include a copy of my personal FAQ on how to get the games from Mastertronic.

[Dave Lebling writes]

Mediagenic licensed the UK rights to the games to Virgin Mastertronic about two years ago.

Mediagenic went nearly bankrupt, was taken over by outside investors, and taken through a so-called "pre-packaged Chapter 11 bankruptcy" in January, 1992. As part of that process, they changed their name back to Activision, moved from Silicon Valley down to LA, and recently merged with a company owned by the investors (called The Disc Company).

[Nathan Torkington writes]

Douglas Adams' "Hitchhiker's Guide to the Galaxy" adventure game is being reissued by Virgin Mastertronic. Their advertisement in the Aug/Dept 1991 "XS NRG" magazine (hey, it's not mine! - I wouldn't buy something with that tacky a title) shows the covers to
The Hitchhiker's Guide to the Galaxy
Zork I
PlanetFall
Wishbringer
Leather Goddesses of Phobos
Zork II
Zork III
Enchanter
Sorcerer
Deadline

and the text reads:
Ten good reasons to use your imagination
Classic infocom interactive fiction is back -- at an irresistible price.
Available on PC, Amiga & ST : #9.99 (# == British pound)
INFOCOM from Mastertronic
For further information please contact:
Customer Services
Virgin Mastertronic Ltd
16 Portland Road
London W11 2LA
Tel: 071 - 727 8070

I hope this helps. Remember that if you write to them asking how to order the game, it would be a good idea to let them know how much you enjoy interactive fiction (text adventures). That way they may (re?)release more ..

Message-ID: <1992Jul6.152823.8914@news.uit.no>
Source record: 110697

Would someone please be so kind to teach me a little about the innards of the 8bits?

I think character sets are done as on the C=64, with hires straight bit-to-pixel mapping, and lores combining to bits into one doublewidth pixel.

But what is the size of the sprites, and how are they stored in memory? Are player and missile sprites different?

Does there exist any textfiles describing hardware and OS(calls, parameters etc) that can be gotten from somewhere ftp?

(email happily accepted)
Thanks in advance

It's always sad to see people from the "one guy can make a difference"
days of home computing get absorbed into the big, faceless corporate
programming environment. Once of the nice things about the Atari
world was/is that software from little companies always recieved
just as much press and the big players: Kyan Pascal, Draper Pascal,
The First XLent Word Processor, etc. In PC-land, you're completely
out of the running if you don't get Borland or Microsoft to pump
millions of advertising dollars into it.

You could be right about them being a "ME TOO" feature.
IMHO: Somewhere along the line in the Warner Atari they decided to go with only 2 joystick ports. No data on why, could be no one was playing 8 player paddle games. I imagine 'they' decided to go for the business market so they added the cursor movement, display off for faster processing, etc to the function keys. More IMHO: The 1200 was really a better computer then people gave it credit for. But I remember even after they discontinued it & had a fire sale on them they were still going for $279 W/O BASIC. BASIC was still a $50 add-on, 1010's were about $100. Some of the 1200's competition at the time were $50-$100 TI99/4's, <$200 C-64's, Timex Sinclair 1000 for $50-$150. I think the only computers that were more expensive then the discontinued 1200 were Apples & IBMs. If they could of set a realistic price on the 1200 it may have sold better, but with the bloated overhead that was Warner it was doomed. I've been there before with another company & it's not fun. You work your butt off to get a product out & after the bean counters add 600% overhead to the cost of manufacturing, YOU'RE DEAD <g>. Figure the Warner Atari was about 7,000 employees while the current Atari is about 200.

Source record: 110700

Yeah, I think the 1200XL is a good machine too. Although I wish it was a 1400XL, if only for the addition of the Parallel Bus. Sure, you can add one to the 1200XL, with one TTL chip and a lot of wire, but it would have been nice for it to be just sitting there. I think your guess is correct, looking at the 1400 and 1450, it's kinda obvious these machines were gonna be more business oriented and less of a game machine . Why else would you have speech synth. and a built in modem, and high capacity disk drives?

I still hope Bob Woolley will make either a really small floppy interface board, or IDE controller board, because then I can mount a floppy or HD inside my 1200XL. That would be great. That is one of my biggest turnons about the machine, there is actually some room in there to throw in homebrew circuitry. Hook up an external +5V power supply, and remove the internal AC->DC conversion stuff, that huge heatsink, and the RF box, and you have even more room.

Jeff

2603. Re: Opened my Atari 800... Fast Chip... Floating Point ?

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-06 20:13:03 UTC
From: jwf10@ccc.amdahl.com
Message-ID: <c1e502oG180e01@JUTS.ccc.amdahl.com>
Source record: 110649

Yes, I just recently added a Newell Fast Chip $19.95
Isn't it funny how everything in the US is $19.95 - I have the
suspicion that Ronco has something to do with this price setting.
(If you have watched late night TV in the US you'd understand)
Anyways, I opened the top of my 800 for adding this chip. There were
only 4 or 5 boards - this was disapointing. But this fast chip is
supposed to speed the floating point calculations, up to 5 times as fast.
But I haven't noticed. In fact I wrote a tiny program in BASIC to test
before and after: 10 for x = 1 to 3000
20 a = a + 1.03456
30 next x
But there was no inprovement. Isn't line 20 using the floating point chip?
It took 15 seconds before and after I installed the chip. What's the deal?
Is this chip really made by Ronco?

2604. OmniComm and the 850.

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-07 00:34:10 UTC
From: a644690c@edinboro.edu
Message-ID: <0095D2F3E5E0F960.20801E2B@edinboro.edu>
Source record: 110701

First a question about OmniComm: Has anyone ever fixed the Character set
so that the vt100 graphics work properly. (ie. The inverse characters are not
full height so a block of inverse characters appears to have lines running
through it.) I usually use K65 because of the better graphics but Omnicomm
seems more flexible.

On to the real info: OmniComm works fine at 2400 baud for me (using an MIO).
There should be no problem with an 850 either. Here is a list of parameters
for setting the XIOs in Omnicomm:

XIO 36 - Baud Rate (aux1. bits: 3,2,1,0)
- $00 : 300
- $09 : 600
- $0A : 1200
- $0C : 2400
- $0D : 4800
- $0E : 9600

- Word Size (aux1. bits: 6,5,4)
- Add $00: 8 bits. (no bit set).
- Add $10: 7 bits. (bit 4 set).

- Stop Bits (aux1. bit 7)
- Add $00: 1 Stop bit.
- Add $80: 2 Stop bits.

- DSR, CRX, CTS (Aux2. 2,1,0).

I can't remember off hand what Omnicomm asks, but these are the primary
things. For Example: 2400 baud, 8 bits, 1 stop bit = $0C + $00 + $00
or $0C for XIO 36 aux1.

I have never had the need to set the following:

XIO 38 - Translation (aux1.)
- Add $00 Light ATASCII/ESSAY.
- Add $10 Heavy ATASCII/ESSAY.
- Add $20 No Translation.
- other values control Parity etc.

XIO 34 - Controls XMT, RTS, XMT.
- (I'm not sure if this is asked for.)

XIO 40 - For Concurrent/Nonconcurrent mode I/O
- (Not asked for in OmniComm but may be useful to some.)

I hope some of this helps.....

Has anyone thought of trying to get Compute!, Antic Publishing, and LFP (last owners of ANALOG) to release free reprint rights (if not release outright into public domain) all their published programs, articles, and books for the Atari 8-bit? Now THAT would be a resource.

You have answered your own question: binary (i.e. machine language program) files must START with a dual $FF $FF (<255> decimal), all other references are optional. Each memory block loaded must have its own load range listed. Assemblers such as the MAC65 tended to create many more load blocks than needed (it often breaks consecutive memory addresses into multiple blocks) which slows load time. BTW, I wrote a BASIC program several years ago called *BFAR.BAS which reads a ML file and indicates all load ranges AND detects INIT and RUN addresses. It was a blessing when I had to modify someone's code to run under SpartaDOS X. I *think* I uploaded it to ICD's BBS, and I definetly uploaded it to the SPACE BBS (St.Paul) [612-488-5973].

Sold his 8-bit stuff to SJC as a trade in. Said he got the equivalent of a $150 for computer, couple of drives, & 10 meg hard drive. Used it as a trade in on a ST for his son so he could do some animation stuff, but it seems like he uses it for modeming more. It's been a year or so since he I've talked to him in person so I'm sure I've got a few things wrong, but.... The doesn't really matter comments came after he'd made a few comments about decisions he'd made at OSS. It came out more in the vein, "You know you can do your best but things outside your control can cause you to fail through no fault of your own" It was understood that things like IBM moving into the PC market place, Warner, Tramiel(s), dram shortage, etc. were what he was talking about. I think he offered the source code for Atari Basic on disk & a few other choice items to any interested kid (I definately was to old for that one <g>) & got no takers. Right now he's trying to convince Phone Bill to buy Basic XL, but Kendrick's putting up a real fight. The new officers of BAAUG are trying to change the "Mention anything about an 8-bit & be trashed" rep of the club, so I think Wilkinson even offered to let them reprint his Insight Atari columns if they can get Compute to approve it. I really wish he was still writting SOME WHERE! I doubt if he has the time, but I'd renew my subscription to Dr. Dobb's if were were to do a tutorial on Pascal or Forth or C++ or anything else for that matter. I really enjoy his sense of humor & style.

I have used OmniCom for over 5 years (although I usually use my TT now :-), and I rarely had a problem with its ^S and ^Q "trick." OmniCom, running at 2400bps, using that flow control, worked fine (and still does on the rare occasion I use it) with various Unix systems (all SysV-flavor Unix), several BBSs, and Delphi. I did run into a problem on our user group's BBS - if _I_ used ^S and ^Q to pause output, I would end up in a "fight" (I don't recall exactly what I thought was happening) with OmniCom's flow control. The solution was not to press <CTRL>S and <CTRL>Q, but to use the HELP key (which pauses/resumes output _locally_ to the Atari display on an OmniView-equipped machine; like <CTRL>1 on a stock machine) and let OmniCom handle the flow control. That seemed to work perfectly. I wish OmniCom had more than plain vanilla 128-byte block Xmodem, and Kermit; but then again, I haven't had much luck with Xmodem-1K or Ymodem (dare I try Zmodem :-) using my TT....

OmniCom - one of the best 8-bit terminal programs, especially if one needs 80 columns.

I only know a little about the C-64 sprites. As I recall the are something like 8X8 or 16X16 blocks that can be positioned both vertically and horizontally by writting to a single register. I don't think they can be more then one color, but they can have 4 or so on the same line or in the same area to make a multi-color/multi-sprite character. P/M on the other hand are vertical bars that run the height of the screen & then some. You're limited to 4 player strips with 4 missles or 5 players. By writting a DLI you can have a number of incarnations of players at different positions vertically, but it's tough to get more then the standard number on the horizontal. I'd have to look it up to be sure, but I think PM's must start on a 1 or 2k boundry depending on the rez you're using. I don't know anything about C-64 character sets. We have the Antic so it converts the value in screen memory to it's bit mapped image, but it isn't really a bit mapped image in the Mac sense. It's still only 960 bytes even though the rez is comparable to graphics(8). I'm not sure if the commie can do multi colored characters either. If you need to know how GR.(12) or GR.(13) characters get their color, let me know. I've got a number of goofy utilities for doing things like converting a micro Illustrator .PIC to a character set.

As regards ^S/^Q handshaking between the Atari and a Unix system, or between anything else and a Unix system, which "works at 1200 but doesn't cut it at 2400:" It sounds like there's some "typeahead buffering" going on on that Unix system, such that by the time the Atari (or whatever) sends that ^S, the Unix system has already buffered up a slew of characters and it is, literally, TOO LATE to stop them from spewing forth. The usual solution to this is to have the Atari (or whatever) send that ^S BEFORE its buffer actually fills up, and to have the Unix system (if possible; I don't know Unix very well) reduce the size of ITS output buffer, so that the Atari's buffer always has room for the maximum possible number of characters the Unix system can be expected to send AFTER receiving the ^S.

Did that make sense? It's getting late and I'm babbling just a bit.

Hey gang, here's a cool thought for some future generation of Atari 8-bit reincarnated dream machines... I just read in Digital News this week that somebody (HP?) has come out with a 1.21 meg hard drive that is about 1" by 1" by 2". Yes, that's INCHES. The damn thing is about the size of a match-box. Development calls for a 5meg, 10meg, and 20meg unit with similar di-mensions within the next few years; it's targeted at putting HDs into hand calculators.

Another useful thing to keep in mind is that if after your Binary file
ends, it if is followed by E2 02 E3 02, which means that that the next two
bytes will be a run address that will be executed immediately.
If instead you have E0 02 E1 02, then the address following this will
be executed upon completion of the file being loaded. I discovered that
if SpartaDOS X doesn't fine one of these, it assumes the program
starts executing at the Load address. This proved fatal for the ST mouse
handler I posted earlier. The code loads into page 6, but the first
5 bytes are for variable useage. The code was designed to just be loaded, and
then executed from a BASIC USR call later on. Anyways, X crashed pretty
badly, wiping out the RAMDISK every time. By appending a E0 02 E1 02 to
the end of the file, followed by the address of an RTS in the code,
the handler now loads just fine for Sparta X.
I wasn't aware of these Init and Run vectors until I read through the Omnimon
XL documentation, which talks about it. Thanks to Newell for supplying me with
an answer to a nagging problem I had...

TOWEL?!?!?!? That original box must have been pretty big if you could fit a
towel inside of it...

;-)

Actually, for you nostalgia buffs in the audience, here's a complete list of
trinkets from the HHGTTG box (Atari version):

- Game disk (of course) - 2 sided.
- Peril-Sensitive Sunglasses (actually made of black construction
paper, so they are always pitch black and impossible to see through). "Not
recommended for driving," says the fine print.
- Destruction orders for Arthur Dent's home and the planet Earth (the
orders for Earth are written in what I assume is Vogon).
- A "Don't Panic!" button.
- No tea (just like the kind professional hitchhikers don't carry).
- A microscopic space fleet in a small plastic bag.
- A quick refernce card.
- An instruction booklet with humorous late-night-Ginsu-knife-TV-ad-
spoof intro section hawking a Hitchhiker's Guide to the Galaxy for the low low
price of 59.99 Altairian Dollars.
- An mail-in card for Infocom hint books.
- A Warranty Card.

COMPUTE! is still being published, so it shouldn't be too hard to
ask them. ANALOG and Antic are a different story. ANALOG gave
authors the option to either sell or keep their rights (with the
former paying slightly more). And when they went under did
all rights revert to the authors anyway? Does anybody know
the whereabouts of Lee Pappas? (Seeing as Bill Wilkinson has
resurfaced lately...)

Antic Publishing somehow transmogrified into a different
company which puts out that awful PC Home Journal magazine.
James Capparell is still in charge, so once again somebody
could call him up and ask (don't believe anything you don't
get in writing, of course).

Well, like I said, I wouldn't use me as a reference in an encylopedia but:
I think Bill chaulked it up to 3 or 4 things. Sequence went something like;
when the price of 8-bit computers (remember OSS had Apple products too)
dropped there was a general resistance to spend more for a cartridge then you
could buy the computer for. I think he guessed the ratio at about 1/5. Thus
people will spend $100 for Turbo C for their $500-$4000 clone, but they won't
give more then $20 for a cart for their $100 Atari. This wasn't even enough
to cover the cost of manufacture for a 16k banked switched cart! I guess
he kept 8-bit programmers on the payroll as long as possible which also hurt.
Most of the people that used OSS carts were developers so when they moved on
to other platforms, that hurt. Remember OSS Personal Pascal for the ST? I
think he also counted on what the Tramiels said they were going to do with
the ST in the USA, so when the ST never really became a market force it
hurt. I think he said the final straw was a Mac product they cam out with,
a Modula II compiler. It cost something like $30000 to develop & never
covered those cost. I guess he also had some problems with German programmers
that he never really spelled out (late, buggy code, ???).
I guess the thing is there were a lot of changes that could have made the
company more successful. How about distributing Personal Pascal with the ST
instead of that feable Basic they come with, for example? But the end would
still be the same. Even if everyone that had anything to do with Atari made
nothing but "RIGHT" choices, IBM would still crush them in the business
market place => home users would want a computer compatable with the one at
work => no room for anyone else. It's not a matter of how hard you try or
how good you are, it's just a matter of time.

2623. col80.obj

Newsgroup: comp.sys.atari.8bit

Message-ID: <9207071627.AA10132@brachot.jct.ac.il>
Source record: 110619

Hey everybody,
I just gave John Dunning a prog to post on the archive. It's supposed to be called "col80.obj" (in 8bit/new) and it's a fast 80-col file displayer. How to use: load with option L of DUP.. (It's in M/L!) This prog has been tested against Mydos only, but it should work with the Atari DOSes.
All it does is first prompt you: do you want Unix or Atascii EOLs? This means does the file have a 10 (^H) to end a line, or a regular <RETURN> (155 or $9B)? The only special chars it recognizes are the EOL you specified, and TAB, which is 127. (same for both modes.)
After this, it'll ask you for a filename. Specify Dev:filename in standard format. The file will begin loading into the buffer, and then immediately start spewing stuff out. Note: if the buffer got full before the EOF, (it's quite big - from about $3000 to $9000) it'll print everything and then refill the buffer, until the EOF. When the EOF comes, it'll empty the rest of the buffer to the screen, print a small message and prompt you to press [RESET] to restart.
A few things A) the program is Reset-proof. On a press of Reset, the DOS will Init, and you'll be back at the prompts.
B) You can press Ctrl-1 to pause the printing at anytime.
A few notes:
Look at the speed!! It sure is a good example for those who want to write a 2400 baud terminal emulator!!
It was acheived by rolling around the LMSs and clearing the line that gets to the bottom. I never really scroll 8K! ha ha ha ha! :-)
Now remember, this program was meant only to demonstrate a point, never to be a commercial program. I whipped it up in two days.
It should serve an example for all followers who want to create a good 80-column screen. And who knows? I just might expand it to make a really good README'er. Bye!!

If OSS had ventured into the MS-DOS world (ugh) they might have
been able to stay afloat. There still isn't anything along the
lines of MAC/65 with Action!'s text editor for the PC. In 1986
this would have made a killing. (I really can't believe that
no one has ever written an integrated assembler/editor/debugger
for the PC). Or imagine a beefed-up version of Action! The
MS-DOS world has only known one really fast little compiler
with an integrated editor (Turbo Pascal), but it has gotten
bloated in recent years.

I second the wish that Bill W. would write a column or book
or something.

2625. Atari User Group Meeting - Wed July 8/92

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-07 17:36:07 UTC
From: daroloso@math.waterloo.edu
Message-ID: <Br14w9.1s5@math.waterloo.edu>
Source record: 110623
Cross-posted to: uw.sys.atari,comp.sys.atari.st,comp.sys.atari.8bit,kw.micro,ont.micro

In July, the Kitchener-Waterloo Eight Sixteen Thirty-two (KWEST)
Atari user group will have an informal general meeting.

Our 16-bit library currently has over 400 disks of public domain
and shareware software.
In addition, there will be our disk-of-the-month.
Our 8-bit library is also available at this meeting.

We will also give attendees the July issue of AtariUser.

The group welcomes new members and visitors with
8-bits, 16-bits, or those just curious.

Meetings held at the University of Waterloo in the
Math & Computer Building.

Room opens at 7:00 pm. Meeting starts at 7:30 pm.

Wednesday, July 8, 1992
DCS Course Room, Room 2009 (2nd floor)

Call 725-2068 for more information.

Hope to see you there,
Dani Roloson

Source record: 110622

Hmm, sounds like there were a lot of horribly tough breaks.

I agree with what you said about people not wanting to pay more than $20.00 for a $100.00 machine. But that base system price is misleading, by the time you add a TV or monitor, and a floppy drive, you're up to about $300.00 + which is what comes in a PC system at the very least.. so I think that if people has considered their total system price as a basic of comparison with prices for software, then paying $40.00 for an application or programming language isn't so bad.

It is really too bad that Atari didn't incorporate BASIC XL into 800XL machines, and BASIC XE into XE machines. That is what should have been done IMHO, and I think I heard a similar comment a while back. Same goes for Personal Pascal for the ST.

I've now got almost everything OSS had put out for the 8 bit, I think, except for the MAC/65 toolkit and the Monkeywrench. The stuff I have is all very high quality. The only thing I don't like about their BASIC XL/XE is the way they had implemented local variables and Procedures. It's a step up from what TurboBASIC XL supports, but the parameter passing was always a bit confusing to me. Which I found strange, because I am getting along quite well dealing with Action! parameter passing, etc.

If that user group does start reprinting the Insight Atari columns, please post something here, to let us all know. I'd hate to miss it a second time.

Jeff McWilliams

2627. 800(xl) software needed.....

Newsgroup: comp.sys.atari.8bit

Hello...

I am back to the Atari scene (again!). I put my 800xl
in the closet when i got my XT three years ago. Well
needless to say I am back. My problem is that my dad
has thrown out/given away/written over all my software.
I have probably over 350 disks. I am now trying to get
software, so I can use the XL. I have dos 2.5, unarc,
Bob term 1.22a (I can't get it to talk to the modem!)
discomm 3?, and that's about it. As hardware goes, I
have a 800xl, 1050, monitor, P:R: connector, 2400baud
modem (for the XT, but I can use it on teh Atari(I think))
joysticks..

I am in DESPERATE NEED for some software! If you could
help me, i will greatly apreciative! If you could help
me get the modem to work with the XL, the same thing!

Well I am glad I am back (as long as I can get some software!)

-Scott B.
-c3460350 @ Fsu1.Cc.Fsu.Edu

PS> I have a 800 w/ 48k and a Percom Disk Drive for sale.

And people will gladly pay for quality software. All MS-DOS C
compilers are just loaded with bugs and are s-l-o-w and bulky, but
that doesn't seem to stop people from dropping $300+ to get one
(and I'm not just talking about developers either, but college
students, etc.).

One problem with ^S/^Q is that on a lot of systems, control-S pauses the output, then any character received will start it again, even another ^S, or line noise. And many systems will unpause after a certain number of seconds.

Borland comes as close as most people need with Turbo Assembler and Debugger,
and when you couple these two with Brief you have a MUCH better package
than MAC/65 ever was. Now that Borland owns Brief, I wouldn't be surprised to
see Brief bundled with the Turbo Assembler, Debugger, Profiler, and other
tools, and certainly with the next version of Borland C++.

I agree, however, that had Wilkinson switched to the ISA camp back in '86
he'd still have been able to keep doing development tool type packages.
Turbo Debugger didn't come out until 1988 or thereabouts, and CodeView,
like anything else from Microsoft, was way overpriced. OSS had a nice
niche to slide into, had they been interested in beating Borland to the punch.

Ah, well...

I'm posting this for a friend. Reply to me however. I don't know anything about the system other than what's listed here. Would prefer selling the system as a package, i.e. not selling items separately. COD-cash payment is preferred.

FOR SALE

Atari 1200XL
Atari 1050 Disk Drive
Atari 1027 Printer
BMC 12" Monochrome monitor

Manuals and power supplies for above. [He may have original boxes for them, too; I'm not sure. I can find out if necessary. -- Ed]

30-50 disks, most with programs.

Everything's in good working order. [I don't think the stuff has really been used much.]

Best offer plus shipping. [The person who's selling this is in Concord, California, so if you're nearby, you could probably pick it

2634. seedfill in Action!

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-08 06:47:03 UTC
From: Jeff McWilliams <JJMCWILL@MTUS5.BITNET>
Message-ID: <92190.014703JJMCWILL@MTUS5.BITNET>
Source record: 110631

Attached is a seedfill I found by looking in a recommended FTP site
mentioned in COMP.Graphics.

The routine is written in C, and I plan on taking a shot at porting it over
to Action!
Converting the actual code over won't be too hard. The Action! manual shows
how to access to array or records, which is what the Struct array stack is.
I plan on probably using all cards for my y,xl,xr,dy since my virtual page
is larger than a 320x192. But that could be changed to handle just
a gr.8 screen where all the variables except x could be BYTEs.
The problem is memory allocation. The code is working with an array
holding 10000 elements, which if Shorts are two bytes long, means
that it actuallyis 80000 bytes large. Obviously the code was written for
a workstation, or something larger.
I don't think it need to be that big, but there is still the problem of
allocating memory for the thing. Can it be done dynamically in Action?

I think the Toolkit has some allocation routines, but they are pretty poor,
since you have to type a command from the Action monitor, and I would like
this seedfill code to be put in a standalone program that will be compiled
with the Runtime package.

One thought I had was to dedicate a 16K XE type bank to the Stack array.
I think 16K would be large enough for my purposes.

Translating the code from C won't be a problem for the most part, except
for the afore mentioned memory handling problem. But I am afraid that perhaps
the resulting code could end up to be quite slow. Is there a machine language
guru who is looking for a challenge and would like to implement this seedfill
routine in 6502 code?

Jeff McWilliams

code follows....

```
/*
A Seed Fill Algorithm
by Paul Heckbert

>Sheesh!

Whoa, relax! I *own* a PC and use it almost daily. And I
don't have any major complaints about it. But unfortunately
it seems that it is the acceptable norm for development
software to (1) require a 40 MHz 386 to run at a decent speed,
(2) have many bugs because new versions are released every
few months, and (3) require the purchase of a new bookcase
to hold the manuals. IMO if an assembler requires 500+ pages
of manuals to describe it properly, then something is wrong.

Back to the interesting Atari discussions...

It would work, but I don't think I could tolerate the flicker for very long.
Your character set will still be as ugly and hard to read (because of the 3x8
pixel limit), but with serious flicker added on top? What prices we pay for
speed. :)

> Applications like ANSITerm can't use this idea because it needs the ability

The Atari has a 256-byte character set. So is the IBM extended character set.
It doesn't require graphics to display all the wierd characters, just a
redefined set.

Building a symbol table is a good idea, yup. Allow the user to move back and forth over the code, renaming generated labels to more meaningful ones. Display the binary data as disassembled code, ATASCII, bytes, or words. The user can mark a range and define it as one of those types, and that info is also added to the symbol table. Once in a while the file will have to be rescanned for building new labels, because it makes mistakes until the ranges have all been defined correctly.

I'm guessing no- mainly because the 1200xl's were only in production
for...oh...2 months..? The only other 8-bits that had them were the
1400xl and 1450xld, which I believe were never "officially" released.
(tho they'd've been pretty impressive.... anyone know why they dropped
them.... !!-> let alone how much they cost to design!?!?! <-!! esp.
back then! wheew!)

If any was, I'll bet you anything that it was re-made to be compatible
with f-key-less systems (pretty much everything BUT the 1200xl/14//xl's)

I still like changing the character sets, turning off the key-click,
locking up the keyboard, and being able to manually turn off the ANTIC
chip... (AND turn it back on when I'm bored... :))

am I wrong here? if so, whatever became of the f-key software!??

From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <qqDmNB18w164w@cyberden.uucp>
Source record: 110645

Well.. I hope nobody minds the post:

Here's all ya ever wanted to know about character sets and p/m's.. (well, just the basics...) (btw: we'll do it IN basic)

The character sets seen on your display are set by a pointer location at address 756. Normally, it's 224. If you want the international character set, you change it to 204. Most people usually choose to set their character sets relative to the top of RAM (address 106 points to that). I usually choose 16 pages above it. (you'd say "CH=(PEEK(106)-16)*256" and then set the pointer with "POKE 756,CH/256") It'd be a bit tough to stick a character set within string memory, because they move around alot. They're also not always sitting EXACTLY on a page (if it didn't matter, you would POKE 2 pointers (LSB,MSB format) to the character set. That'd be pretty nice for scrolling all the characters around... but why would you want to do that?) BTW: another note: in normal text mode, if the pointer points above the page that the character set sits at anywhere from 1 to 3 pages (not positive about this) the character set will not change. If it's in GRAPHICS 1 or 2 mode, then the non-text window characters will become the 2nd half of the character set (uppercase = lowercase, control characters replace a bunch of the punctuation/#s, etc.) when you move the character set pointer 2 pages. (ie, POKE 756,226 would give you lowercase...spaces would be hearts, etc.))

Anyways... you're right about how characters are made.. You'll need alot of practice or a chart to figure out what characters sit where. Space is character #0, not #32 like in AtASCII. (this is just like when you POKE/PEEK to screen memory.. if that info. helps you). I'll take it you also know how to make multicolor characters, so I wont get into that either.

Now for player/missles. They're a bit more complicated.
(getting out his notes on the subject...)
Your first job is to find yourself some free RAM. You can do this just like with the character set. You might need an extra 4 pages (1K) if you use the hi-y-res mode. (Xx192 instead of Xx96 for resolution).
Here's the steps in setting up the p/m's:
find free RAM
POKE 54279,freepage this location works alot like the character-set pointer at 756
POKE 559,46 or 62 this depends on the res. 46 is low, 62 is high
remember that you can still adjust the other
bits of 559 to set playfield, etc.etc.etc.
but 46 and 62 I believe are equivalent to 559's

default of 34, except with the p/m bits on
POKE 53277,3 this turns on the players (I'm not sure what
any other values do to it.. 0 is off, default)
POKE 704+sprite,color location 704 is the color register of player 0
as well as missle 0 (unless you have the missles
set up as a 5th player.. I forget how to do this-
all I remember is that it's color becomes the
same as color 3 at location 711)
POKE 53256+player,width this sets the width of each player (note: sprite
(player/missle) values are from 0 to 3! not 1-4!)
0 = normal, 1 = double and 3 = quad (2=normal)
POKE 53248+player,pos. this sets the X-position of the players. it
ranges from 0 to 255. 48 being leftmost, right
where the playfield starts (inside the left
border) and the playfield is given a width of 160
(just like med.res graphics) and if you dont want
the player going off into the right border,
you've got to calculate where it goes into it,
because it all depends on it's width.
POKE 623,priority this selects the priority (who goes over who
when two players/missles overlap each other
and/or the background) See Mapping the Atari
for more details, or ask me and I'll post/mail
the info. I believe 17 is normal. (???)

Now for making the players (I won't get into details about missles,
because they get complicated). Here's a memory map of who goes where
when you have location 54279 set to the variable "PM":

double-line res (559 set to 46):
PM -------------
^ | |
| | un-used |
| | |
v |___________|
PM+384 |M3|M2|M1|M0| - the missles.. hard to explain...
^ | | | | |
v |__|__|__|__|
PM+512 | player #0 |
^ | |
v |___________|
PM+640 | player #1 |
^ | |
v |___________|
PM+768 | player #2 |
^ | |
v |___________|
PM+896 | player #3 |
^ | |
v |___________|
PM+1024

As you can see, each player is 128 bytes long. This spans from above the top of the screen, to below the bottom of the screen. Pretty tall players, eh? Their only flaw (?!) is the fact that they can only be 8 bits (1 byte) across! (geez. reminds me of the Amiga's tall sprites!)

in single-line res., the unused stretches ALL THE WAY down to PM+768, where the missles start. In this mode, (since the p/m have twice the resolution) the p/m's are 256 bytes long. The missle stretch from +768 to +1023
player 0 : +1024 -> +1279
player 1 : +1280 -> +1535
player 2 : +1536 -> +1791
player 3 : +1792 -> +2047

When you want to move a player up or down, you have to rewrite all of it's bytes (not ALL 128 or 256, unless the actual image within the player is that big!... just the image's size, remembering to erase above and below it, as not to leave a trail). In double-res mode, the 1st byte of pixels to appear below the top border start at PM+offset (see above) + 16. And, you guessed it! :) In single-res mode, it's +32!

Well.. I hope this taught you at least a little. It's help me get through the hell we call player/missles. (hell at least in BASIC! :)) Some nice effects if you need less than 4 players is to mix players together to make them either wider w/o loosing resolution (quad looks disgusting!) or have more colors, if you can create the byte values correctly. I suggest getting a good player/missle editor. I believe someone on the Net was working on one...?

Well.. that's my $.2 on the subject. good luck

I was just inside a friends 1200XL and was surprised about all the
room. I thought about getting a hold of a broke 1200XL and either a
800XL or 600XL (would prefer a 600) to stick inside the 1200 case. Then
you would have the PBI and a whole lot more room!!

Message-ID: <Jim_Johnson.05g3@abcd.Houghton.MI.US>
Source record: 110651

YES! There is a way for an IBM drive to read/write an 8-bit Atari disk. Several translators are available from GEnie or Compuserve. Most require the Atari disk to be in MYDOS single sided, double density format. Most also offer the choice of translating to/from Atari EOL ($9B) and CR/LF character sequences at the time of transfer. Yes theycan also move non-text file formats between the machines, but of course the code cannot be run except on the machine it was written for. Back in the bad ole days, I used to do this all the time. You can even move datafiles using the DIF format between the machines (if the software on both machines supports DIF files).

There is a software only 80column term program for the 8bit called
"Term80". Better yet it is in the public domain. It only supports upto
9600 bps and needs a monochrome monitor to have a useable display - but it
works quite well and is very cheap.

2654. gif pictures, etc.

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-09 06:45:20 UTC
From: tac10@isuvax.iastate.edu
Message-ID: <1992Jul9.064520.11367@news.iastate.edu>
Source record: 110650

What is the format of a binary 'gif' file? Are there any
utilities for translating them into some atari displayable format?
Someone loaned me their spiffy printer, and if I knew the
way binary picture files were formated, I could write something
to print them, or crunch them into some 8bit display, or show
only parts... I have no experience with downloading and displaying
images of any sort; but this old 800 is just a tool waiting to
be used. Please give me any information you can.
Paul

The fact that there is so much support and information available
for the 8bits is quite amazing to me. Im not anachronistic, but
if the old Impala still runs and gets me from place to place, why
buy a new one?

2655. Atari 850 specifications

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-09 08:43:55 UTC
From: mfolivo@sactoh0.sac.ca.us
Message-ID: <1992Jul9.084355.10877@sactoh0.sac.ca.us>
Source record: 110505

From an Atari Product Catalog, circa 1982, here is some blurbs
about the 850 and the serial ports.

Features
* Direct serial interface to ATARI Home COmputer
* Programmable
* Four serial interface ports for use with the ATARI 830 Acoustic
Modem and other EIA RS232C-compatible peripherals: All have Send
and Receive data signals. Port on has five additional control
signals (Data Terminal Ready, Data Set Ready, Clear to Send,
Request to Send, and Carrier Detect). Data Terminal Ready and
Data Set Ready signal readiness on ports 2 and 3. 20mA current
loop is connectable on port 4 for teletype.
* 8-bit parrallel (Centronics type) interface port for use with
ATARI 825 80-column printer
* Automatic telephone answering when used with an appropriate
modem.
* Full duplex operation
* Programmable Baud rate on any port, including 75, 110, 134.5,
150, 300, 600, 1200, 2400, and 9600 bits per second. Baudot
speeds of 60, 66, 75, and 100 words per minute.
* Baudot support for radio-teletype (RTTY).

Hope this is useful.

From: Jeff McWilliams <JJMCWILL@MTUS5.BITNET>
Message-ID: <92191.091413JJMCWILL@MTUS5.BITNET>
Source record: 110506

There is a ftp site 128.112.128.1 which has some source code for three
books: Graphics Gems I, II, and III. Unfortunately, the files
are names filename.tar.Z and when I transferred one to my IBM mainframe
account, it was garbage. SO I suspect the files are compressed somehow.
I also suspect somebody on a UNIX machine can uncompact them, and I am
wondering if there are any UNIX account users out there who would be willing
to do me the enourmous favor of converting the files to ASCII and emailing
them to me. The files are just supposed to be C source code.
I got most of the Files from Gems I, because they were available as
either ASCII or compacted files, but the other two books they decided to
compact the files.

Many, many many thanks in advance.

Jeff

Archive watchers may notice a bit of turmoil going on in the 8-bit section on ATARI.ARCHIVE.UMICH.EDU. I decided that atari/8bit/ was getting too big (mostly when the FTP server started croaking trying to do directory listings) so I've started creating subdirectories and moving things into them. For starters, I'm creating things that are fairly analogous to the ST directory, ie telecomm/, utilities/, etc. If anybody has better ideas about how to organize things, send 'em to me. Sorry for the confusion, hopefully I'll have this settled in a couple days.

Bob Woolley just wrote in the Latest SLCC Journal about doing a 2.5" HD
in the Atari 1200XL. Sounds like he is serious, he is wiring up an EEPROM
to the D600-D7FF area, which is gonna hold his HD code. I guess the drive
he is talking about is about the size of a pack of playing cards. Not bad.
He says the drive, was it 10 or 20 meg? Anyway, it was about $120.00,
for IDE, and he hopes the entire modification should cost around $200.00.
Boy, what I wouldn't do to scrape up the 200 bucks!

2666. Trade Atari 400 for Intellivison, 7800, Colecovision?

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-09 17:33:25 UTC
From: portuesi@tweezers.esd.sgi.com
Message-ID: <n37rij0@zola.esd.sgi.com>
Source record: 110514
Cross-posted to: rec.games.video,comp.sys.atari.8bit

I have an Atari 400 that I would like to trade for an
Intellivision, Atari 7800, or Colecovision system and/or
software.

I have many books, programming manuals, and productivity
software for the Atari. I also have cartridge and disk
games for the Atari that I'm willing to part with, as well.

Note that the Atari 400 has four controller ports, making
it an ideal machine for running M.U.L.E. (unfortunately,
I am not parting with my copy of the game!).

If there is interest, I will make a list of everything
I have available. I'd like to find people willing to
make a deal before I go through the effort of categorizing
all of the stuff I have.

I might also be interested in selling stuff outright,
though I would really like to trade.

thanks,
m.

I recall having trouble getting it to run. For compatability with carts, I think about the only thing you can do is get another OS chip. There's only about 3 or 4 things I remember not being able to run. Demon Attack, Attack on Epgyx (?) Four, GORF. The translator will only run with software that lets you boot DOS (For a cart) or is a disk file itself. Nobody recomends pulling/pushing carts with the power on, but a lot of people do it.

I forgot to mention in my first "forsale" message that
the Atari 400 has a special 48K memory board installed. This is
important, as several games require that much memory, and
the 400 is normally limited to 16K memory.

Please send email if you are interested.

The Newell Fastchip is a rewritten portion of the OS that handles floating point. In the 800, there is actually a separate ROM just for this code, if I remember correctly, so the original was dubbed the Fastchip.
The fastchip routines were also included in the two OS alternatives that Newell Industries offers for the XL/XE computers, the Omnimon XL and the Omniview 256 chip. The fastchip routines claim to gain up to 500% speed over the standard routines.

Source record: 110654

Recently I've aquired an old cartridge with the game Demon Attack
from Imagic. It was really cheap (less then 1DM) but came without
any docs and boxes. I've tried to plug it into my 130xe but it
didn't work. Now I'm not sure if the cartridge is defective or
if it just requires the old operating system.
Anybody knows what's wrong?
BTW: I've tried loading the Translator disk prior to inserting
the cartridge. Now the whole screen turned to red accompanied by
rubbish on the screen but nothing else happened.

Another question: what do you think about inserting cartridges
while the power is on? Is it dangerous for the computer?
I know the newer version of the operating system is supposed to
check if a cartridge has been inserted during the system's VBI
in order to jump though the "cold boot" vector.
This doesn't work either. Inserting a cartridge causes the system
to lock up, there is no power up routine afterwards.

Remember that there is a downside as well. Atari BASIC uses the
floating point routines for everything, especially the fp-to-integer
routine; many timing dependent BASIC utilities and games will run too
fast. (I know it seems like a minor point, but there are a lot of such
programs out there.)

Marek,

Newell's fastchip is anything but new. It's been out for years.
The fastchip routines were then incorporated into the XL operating
system chips he also sells. I remember reading a review of one of
the fastchip products in Analog long ago, and in there they posted
some comparitive benchmarks.

For the person who just told BASIC to add some numbers, try giving
it a real workout, like multiple iterations of taking a FP number
to a power, square root, division, multiplication, etc.
The addition routine may not have been as improvable as the other routines
in the OS.

2675. Parallel Bus Standards

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-09 23:43:41 UTC
From: Jeff McWilliams <JJMCWILL@MTUS5.BITNET>
Message-ID: <92191.184341JJMCWILL@MTUS5.BITNET>
Source record: 110523

I haven't heard much along the lines of developing the PBI standard
we talked about here a week or so ago. I would be willing to
create a file containing the following information, to help people
come up with a standard..

1090XL preliminary specifications
Antic 4 part series on the Parallel Bus, including some large pic files
that print out the schematics
The Analog article on the parallel Bus
A commented disassembly of the OS ROM PBI handler code, sent to me by
Bob Woolley. Basically, he ran a disassembler on it, and commented
in Pen next to the printout to explain what was going on.

Back when I suggested that there be one register, containing an interrupt
bit for each expansion board plugged into the PBI. The 1090XL specs
in one sections states that $D1FF is the device select mask, but by reading
to it, you read a register as described above, where each bit corresponds
to an interrupt generated by its respective Parallel Bus Device.

The 1090XL docs are somewhat confusing, as it starts out being just
a backplane with some decoding, and by the last revision, it is actually
an intelligent device itself, with a microprocessor and RAM/ROM and
stuff. I talked to the person on Genie who posted the specs, as he
owns a 1090XL, and he said his didn't even include a printer port or the
two Rs232 ports that were stated in the earliest specs, so I guess by the
end the couple 1090's that were made were just dump backplanes or something.

Oh, Bob Woolley is talking about adding a ROM to his IDE parallel bus
hard drive, which would contain the handler code for the bugger.
He is gonna take up all of $D600-$D7FF. That is just about all the
register memory available for the PBI. Meaning a person doing this mod.
wouldn't be able to add our standardized Parallel BUS expansion box.
The only other place is
$D100-$D1FE. Unless there is a way to utilize the block of memory
at D500-D5FF. I read that this is a cart enable line or something.
Could that be further decoded, so that only one address is for the
cart enable, and the rest is free to wire up some hardware I/O
stuff? Of course along the same alongs, as long as I am talking
about getting decode happy here, the $D300-$D3FF block
could be fully decoded. Currently the PIA resides here, being
only partially coded so that any write to the D3xx writes to
one PIA register or another.

I realize there may be some legalities involved in reproducing the
Analog and Antic stuff, but I am willing to take the chance of mailing
such a file to a few people in there is genuine interest in it.

I don't think I will get killed for such an act, as long as I give credit to the sources. Or would I?

>in order to jump though the "cold boot" vector.
>This doesn't work either. Inserting a cartridge causes the system
>to lock up, there is no power up routine afterwards.

I wasn't aware that the check-for-cartridge-during-VBI had anything
to do with jumping through the "cold boot" vector. I CAN confirm that
"hot-plugging" (inserting with power on) a cartridge into the 800XL
always causes the system to lock -- but if you load up the Translator, i.e.
get the "original 800" OS back in place, and are careful to plug the
cartridge STRAIGHT in, so that all pins engage simultaneously, you can
do it and retain control of the system. (It helps if the system is
running a tight, do-nothing ML loop, with all interrupts disabled, at the
time you plug the carridge in. This tight loop should check a console key
(START, e.g.) and restore interrupts and return control to you if it sees
that key. This way you can fire up the tight loop, ram the cartredge in, hit
START (or whatever), and regain control of the system with the cart now
mapped into memory. You're after looking into Demon Attack code, I assume
;-). I assure you, it CAN be done this way.

I agree with Darek in so far that the ST is a completely different architechture than the 8-bit machines and therefore the only way to run 8bit code is to develop an emulator - which was successfully done, right Darek?
(As Darek said the entire 80x86 cpu line IS still an 8086/8088, no emulation required.)
Now the thing is, the 680x0 line has more than enough horsepower to "waste" emulating the 8bit (the 6502, ANTIC, 130XE and other supporting chips), and especially the newer chips in the line have the speed to run at full 8bit speed. But I doubt it was worth Atari's effort - however, their mistake was in making it legally impossible for someone else to do so. I feel they could have made a couple bucks on royalties at no expense to ST sales or software development.
Lets face it, the Tramiels had NO vested interest in the 8bit machines. They really wanted to bring the Amiga to market (which was designed by a team originally under contract to the old Atari), and had to do some quick peddling to develop the ST when the Amiga slipped away from them. Just my opinion, but I don't think Jack ever wanted to seriously compete with his first success - the VIC20/C64 line.

This Newell Floating Point chip brings me to another question.
Would it be possible to make a 'software version' of that chip?
You could boot a disk with some FP routines which than hide under
the OS-ROM and simply replace the old routines.
I know that writing new FP routines isn't an easy task, not to
say a lifetime job, but you could just start with some routines
and do the rest when you've some spare time. The new routines
weren't limited to space available in this few KB of FP-ROM
You could simply make a jump to somewhere else in the RAM area
with more KB available for more capable FP routines.

You need a whole lot of processor power to emulate something as
"simple" as the Atari graphics hardware. Think about it: one
write to a single memory address on the lowly Atari 400 can cause
the entire screen to change. If it could be done, then it would
be easier to program PC clones using the Atari 8-bit emulator
than to just use their native graphics capabilities...

Have you heard of Turbo Basic? It's a PD version of BASIC for the XLs that probably does just what you describe- it's a lot faster than regular BASIC in almost all respects, including floating point calculations. (And it does use the RAM under the operating system.)

Rick_Michael_Cortese@cup.portal.com writes:

> doing things like converting a micro Illustrator .PIC to a character set.

Wouldn't this take up the same amout of memory? You'd us a multiple DLI
to change the ch.set pointer down the screen at certain points to get a
full screen.. The thing is, you'd probably set the DLI every 3 lines
(chset=128 characters, 3 lines=120 characters)... that means you'd need
24/3=8k already! That's more than a GR.15 screen!! Unless of course you
made some sort of utility that utilized the ability to use one character
more than once, but that'd be hard. I suppose for Koala type pics (with
the dithering) it might save a little space, but I think that pic ->
chset'd only be good for say a small picture on a text screen or
something.

This is just from what I know. Is there really a good use for
pic->chset'ing???

You said you were in desperate need for software.
Well.. if you really want, I could give you the names/addresses of all
the 8-bit s/w sellers I know of...but my first suggestion is to figure
out the atari-archive. It's a place accessable by ftp or you can send
mail to it for it to send you files!! wowee. It's sorta as if c.s.a.8
was a message base on a bbs, and the archive was the file area. Anyways-
mail to "atari@atari.archive.umich.edu" and in the body of the message
write "help". It'll mail you back w/in 24 hours w/ a help file.

Welcome back. Sorry to hear about the loss.

Btw: another good resource is BBSs. I've gotten most of my newer
software from BBSes. I've only purchased a few programs (years ago!).

Hehe. I could start a PD library! well.. maybe not. :)

2687. Colorizer 1.0

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-10 19:08:29 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <u1mPNB12w164w@cyberden.uucp>
Source record: 110536

I've completed and am nearly finished bug-testing Colorizer 1.0.
Would anyone out there like to test it for me? It lets you add color to
Graphics 9 images. It loads Graphics 9, APAC-2, Prizm and APAC files and
saves APAC-2, Prizm, and APAC files. The screen is displayed in APAC-2
mode (80 x 96 x 256 colors) and switchable to a half & half mode which
has the color data on the top of the screen and the b/w data on the
bottom and has two cursors.

Drawing commands include:
draw
line
ray
outline
fill
circle
ellipse
replace

other commands include:
global replace
clear color data
capture screen to undo buffer
rewrite captured screen from undo buffer

it also has the following menu screens:
status (informs all the info. you'd wanna know as well as letting you
adjust some of the info.)
save (lets you set the save-mode, save-name, and of course save the file)
replace (sets the replace/global replace values)
dos interface (lets you do a disk dir, and delete, rename, lock, and
unlock files)

The program has been written to be pretty foolproof. It's very versatile
and once you get used to it, it's pretty easy to use. If a certain key
does a certain command one place, it does it everywhere else as well.

Anyways... anyone who has TurboBASIC XL's runtime package and a few b/w
images they wanna color are welcome to test it. I might not even need
testers, but I decided I'd plug the program anyways. ;)

It requires at least 32k (possibly 48k??) and an XL/XE. The final
package will include:

full docs.
Main program (compiled TurboBASIC XL)
TurboBASIC XL's runtime package

demo. pictures

Thanx for any interest. This program's been fun to make (so far
:)). My first version was 0.1 (I made it about a week ago) and the new
version (which I started from scratch yesterday-only took about 8-10
hours to make/test) is 1.0. Still more features are planned for later
versions, but I'm not going to get to those for a while.

2688. Re: Parallel Bus Standards

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-10 19:41:44 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <61861@cup.portal.com>
Source record: 110529

I've been doing some shopping & some of my assumptions about IDE connectors was wrong. They make 50 pin & 64 pin devices, so you couldn't use IBM proto cards W/O putting a spacer in or something. Prices for connectors is $1.29 for 50 pin, $2.99 for 64 pin, so I'm not really shure that should be the way to go. Maybe, since the decoding has been done on the 1st connector, you wouldn't need the upper 8 bits of address lines so they could become CS logic for the next 8 boards. Glad to here about Bob & the IDE drives, I haven't made it to a meeting for about 6 months <g>. Shouldn't be a major problem since Bob always includes source code, it could just be relocated or boot from floppy with it loaded in ram. I found a source of Apple 50 pin W/W boards for $9.95. I'm really leaning that route for now.

My son has 'discovered' my old Atari 800. He likes programming in
Basic. I was wondering if anyone had the Pilot language cartridge
and manual they would be willing to sell?
I would also be interested some other game cartridges, too.
Cartridges will have to do, since my old Rana disk drive only works sometimes.

Thanks,
Tom Lockwood

Chu,

Yes, Newell Industries still sells two Operating system ROMS, the Omniview 256 and the Omnimon XL. The first has a built in 80 column E: handler, similar to what you get when running vt10squared, Omnicom, or Kermit65.
It also has a built in Ramdisk handler for Newell 256K upgrades, and a monitor program called ATRMON, which was used for running CPM on the ATR8000 in 80 columns.
My friend uses it for his ATR8000 is CPM every now and then and he really likes it.
The Omniview 256 also uses the older 800 version of the OS, to solve those compatibility problems with some software. It also can automatically copy the OS into the RAM under the OS ROM area, for whatever reason you would want to do this.

The Omnimon XL chip is also an 800 OS, and has a very nice machine language monitor/debugger built in.

The address phone number is as follows:

Newell Industries
P.O Box 253
Wylie, TX 75098

I have an (old) program (1988) that lets you view GIFs on an 8 bit.
Titled AT8GIF it can be an AUTORUN.SYS program. Looking at the
screen (I booted up the 800XL- I use my Megas more) it will let you
convert a GIF to a Micropainter (non-compressed, non-Koala format)
picture, change horizzontal and vertical ratios, enlarge or reduce
the image.

This can be found (?) on CompuServe.

Source record: 110544

Ok, I wrote a more complex fp function and the results were more conclusive.
the Newell Chip 13sec, Atari 31.5sec. Thats 2.42 times faster.

```
10 for x = 1 to 100
20 a = 1.2345/2.3456*3.4567+a~1.0123
30 ? a
40 next a
```

One interesting thing though, the Newell Chip didn't stop with error 11
when it reached overflow like the Atari Chip did. It just wraped.
How can Newell get away with this? And isn't this bad?

Message-ID: <1992Jul11.202338.3876@CS.ORST.EDU>
Source record: 110548

I am considering selling my Atari 800 set up. I loaned it out for a couple of years and had forgotten about it. I would like to keep it but I have no real use for it. So if someone could give me an idea how much it is worth, or would like to make an offer...

Atari 800 48k:
Power Supply
Indus GT 5.25" Disk Drive: (Black)
- Single or Double Density (90k/180k)
- Two Digit LED: displays Unit#, Track#, and DOS Error Codes
- Front Panel Buttons for "Protect" "Drive Type" "Track" and "Error"
Cable
Power Supply
Manual
Rugged Carrying Case / Shipping Container (Black)
Software:
BASIC Computing Language Cartridge (CXL4002)
DOS XL w/Manual
GT Albert E. Spread Sheet w/Manual
GT Data Manager w/Manual
A few other programs

Also, if I keep it, I would like to find sources for software. I know the atari archive is a good source, but I don't know if I can tranfer it to my Atari. (If you have details on transferring from an IBM 5.25" 360k drive to the 90k/180k format please send them).

> ....
>Marek Tomczyk

A few years ago I bought a used game cartridge, "Astro Chase." It _did_ come with a manual, but wouldn't work on my 130XE. I suspected that the program in the cart was incompatible with the XL/XE OS, and when I asked about this on Delphi, someone told me about a translator program called UltraFix/XL, and someone (perhaps the same person) uploaded it to Delphi. (I think the file was TRANSX.??) This translator runs cartridge based programs that are incompatible with the XL/XE OS. But the catch is, after running the program and pressing the HELP key (if I recall correctly), and the screen turns green, you have to then insert the cartridge. I played the game several times this way, until I asked Matt Ratcliff (also on Delphi) if inserting the cartridge with the power on really was dangerous to the cartridge and/or the computer. I knew that _removing_ a cart with the power on was not a good thing to do. Matt told me that neither inserting nor removing a cartridge with the power on should be done. He said his son (?) pulled a cart out of an 8-bit with the power on, and the computer needed serious repair after that. (I don't remember any more details.) So I gave up playing the game and sold the cartridge (got a whopping $.50, yep fifty cents, for it - seems few folks in our user group have old 400/800s these days). Inserting a cart with the power on may not be _as dangerous_ (may be more likely to damage the cart than the computer), but why take the risk?

Yeah. I have AT8GIF also. It was the first viewer I got. It's DEFINETLY not very good UNLESS you have some 320 x 200 + resolution mono images. It did it's best with the RGB'ing. This was before APAC was talked about in ANALOG magazine. If you want a kick-ass GIF viewer, get Jeff Potter's APACView (v.2.3 is the latest I believe). It converts them to 256 colors in 80 x 96 mode as well as letting you make Pryzm and Interlaced APAC pictures (80 x 192 x 256) and viewing them AND luminence only (grey shade) or color only 80 x 192 x 16 pics >AND< red-only, green-only, and blue-only pics. so you can use Colrview (another of Jeff's programs) to see them in 80 x 192 x 4096 or 160 x 192 x 64 mode.

Very good program. He also made a program to view Amiga IFF (ILBM) files called ILBM Read. I've made a program to colorize 16 grey shade pics. into color in 80 x 96 x 256 (APAC) mode which'd be good if you dont like the colors you get in the GIF. It's also GREAT if you have ComputerEyes. It's called Colorizer (currently v.1.1) and'll hopefully soon be up on the archives as well. (hehe btw: I think all 3 of Jeff's programs I mentioned are there.. I got them from BBSes here and there as well as him via uuencoded mail)

BTW: Jeff- ever going to make it load up different screens from GIFs? If I ever get Frame Maker working, you might be able to view multiple-screen GIFs really fast (no conversion needed). It might just get me to work on this program! :)

Source record: 110485

I made a REALLY dumb mistake which ended up in an occasional program abort w/ Colorizer 1.0. It's up to 1.1 w/ no extra features, but it does work a tad bit better. I might also redo the Docs. (at least split them into two files so I can load them correctly into AtariWriter+ ... btw: anyone know how to set margins on TextPro!? :) - I have no Docs for the thing!!)

I'll see if I can convince Ed Krimen or Rick Cortese(sp?) whom I know from BBSes here in sunny CA. to upload it to the archives since BobTerm's being a naughty little terminal and cant upload huge ASCII's correctly.

Anyways.. END OF NEWSFLASH!

2705. Making ColrView images w/ ComputerEyes

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-12 00:39:58 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <B2wRNB8w164w@cyberden.uucp>
Source record: 110483

Jeff Potter described to me what types of filters are good for making ColrView images using ComputerEyes, but I looked around a little (calling a few camera centers, etc) and couldn't find any PLUS I know that they're going to be expensive. Anyways- has anyone had any luck with 3d glasses!?!? :) It came to me yesterday that there are three types of 3d glasses. Dark/Clear, Red/Blue and Red/Green. If I were to get a pair of the Red/Blue and Red/Green then I'd have all 3 colors needed: red, green, and blue! BUT: I'm not sure if they'll exactly work right and except for a few REALLY small photos that I want to make into ColrView pics, 3d glass lenses aren't the best choice. Is there anywhere where I can get LARGER strips/sheets (not HUGE, of course!) of red, green, and blue clear-plastic (not sure of the techincal term for 3d glass lenses!)??? Especially for a REALLY nice and low price ;). I suppose if worse comes to worse I can just capture a grey shade and colorize it, but I've not been the best at doing lips and just last night I saw a REALLY nice ColrView picture of a scene from that old Dire Straights video (damn forgot the name!) I've also made a few nice looking ColrViews from GIFs, but that's sort of useless since I've yet to see a GIF with more than 256 colors which APAC handles w/o using up 24k! :)

ANYWays.. any suggestions? Are "professional" color filters really in fact cheap, and this fear of expense is just a dilusion? :)

thanx in advance

Just an opinion, not to hurt your feelings, but I bought 2-800's from a local wharehouse for $15 each & they still have one with basic, Star Raiders, & Pac Man for $20. You can get a recon'd one for less then $60. The Indus is probably worth $40 to $80. You may get offers as low as $20, but I wouldn't take less then $40 if I was you. Mino problem with Indus they became Future Systems which I think isn't around or supporting some of the older stuff (???). Once it breaks, it's broke.

>Marek Tomczyk writes:
>
>>BTW: I've tried loading the Translator disk prior to inserting
>>the cartridge. Now the whole screen turned to red accompanied by
>>rubbish on the screen but nothing else happened.
>
>This also sounds familiar, but I can't comment on the details of EXACTLY
>what is happening. I've never had, or taken, the time to investigate here.

Often, the case is that the cartridge overwrites $D301, which of course instantly wreaks havoc with XL/XE high memory space (e.g. the operating system). It seemed common practice in many programs I saw to initialize all hardware registers via code such as:

```
LDX #0
TXA
LOOP: STA $D000,X
STA $D100,X
STA $D200,X
STA $D300,X
INX
BNE LOOP
```

(Wow, I thought I'd forgotten 6502 mnemonics.) The STA $D300,X is the culprit in this example. STAR RAIDERS, I believe, has code of exactly this sort. Changing the $D300 to $D302 (so that $D301 is safely skipped) often solves the problem.

>>Another question: what do you think about inserting cartridges
>>while the power is on? Is it dangerous for the computer?
>
>>I know the newer version of the operating system is supposed to
>>check if a cartridge has been inserted during the system's VBI
>>in order to jump though the "cold boot" vector.
>>This doesn't work either. Inserting a cartridge causes the system
>>to lock up, there is no power up routine afterwards.
>
>I wasn't aware that the check-for-cartridge-during-VBI had anything
>to do with jumping through the "cold boot" vector.

I looked at this code once in the 800XL OS. (Unfortunately I've forgotten the address). The code in the VBI calculates a checksum every 1/60th of a second and stores it somewhere in low memory. If the computed checksum differs from the value in low memory, then a cartridge was inserted. If this is the case, it sets the computer to cold boot when RESET is pressed,

and jumps into an infinite loop so that any executing program halts.

>I CAN confirm that
>"hot-plugging" (inserting with power on) a cartridge into the 800XL
>always causes the system to lock

Agreed; see above.

>-- but if you load up the Translator, i.e.
>get the "original 800" OS back in place, and are careful to plug the
>cartridge STRAIGHT in, so that all pins engage simultaneously, you can
>do it and retain control of the system.

Actually, I've found that it's better NOT to insert the cartridge straight in, but to tilt it to the RIGHT as you're inserting it, so the rightmost pins engage first, then push on the left side to engage the pins quickly from right to left:

(forgive crude ascii art)

```
/\
push /c \
/ / a \ push right side in first, then quickly
/ / r \ apply pressure leftwards
| / / t /
|__ / /
/ /
============================================================
| FRONT OF COMPUTER |
============================================================
```

Hope this helps.

2708. More about INIT and RUN (was Re: Timeout for a philosphical question!)

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-12 03:43:08 UTC
From: andrewh@panix.com
Message-ID: <1992Jul12.034308.21731@panix.com>
Source record: 110552

```
One more thing about the INIT and RUN addresses: after the two bytes for the
INIT address is loaded, the computer automatically does a JSR to that address.
If the computer eventually encounters an RTS from that, DOS then resumes
loading (or else it goes back to DUP.SYS or whatever). On the other hand,
the RUN address is used only after the file is loaded. What's peculiar is
that SDX is breaking the rules when no INIT or RUN address is specified --
the "normal" behavior (of 2.0) should be to simply return to DOS.

>Agreed; see above.

I have "hot-plugged" cartridges into both my 800XL and 130XE with success. I've done it both while at the DOS prompt and while in a debugger, so I don't think the code in the VBI caused a problem. (Incidentally, I don't think it would be calculating the entire checksum in that code, that would be ~40k cycles per VBI. Maybe I'll have a look at that code...). I've actually done the old trick of saving a cartridge to disk and reloading it from a file.

Hi guys,
I have a newer, rehacked ver of col80 in the archive.
Should be called "col80.obj" in atari/8bit/new at the archive.
If the file you get, when binary loaded says "ver 1.1" it means bingo,
if not it means John Dunning didn't put it yet. Download again later.
This ver has a better ch-set, removes stupid bugs (the prompts, a strange
block character instead of the "insert" char, "tab" nt doing anything etc.)
Please, notify bugs direct to me, NOT to c.s.a.8.
The reason is that I don't read c.s.a.8, only the digest, and very
infrequently.
Bye!

There is a way to get the disk to boot with a cart inserted,
and therefore eliminating the need to "hot-plug" the cart.
The os checks a couple of addresses in the cart to verify
if it is a cart, and to see whether to boot. if you disable
one of the data lines from the cart (how is up to you),
you can fool the os into thinking there's no cart.
Then you can save it to disk, or whatever you need to do.

Good point; however, if I remember correctly, it only calculated a checksum on the upper part of the cartridge memory. It's been years since I touched my 800XL, so this may be wrong.

>on should be done.
>Inserting a cart with the
>power on may not be _as dangerous_ (may be more likely to damage the cart
>than the computer), but why take the risk?

I couldn't find the article, but Bill Wilkinson (of former Optimized Systems Software) wrote a regular column in COMPUTE! magazine called "Insight: ATARI." One of these columns covered this very topic. (The particular issue was one of the later ones, in the days when COMPUTE! seriously started to 'thin out', though as I said I couldn't find it just now.)

He says it's fine to do this, at least on XL machines. He said that if it would cause serious (or any) damage, why would Atari have made the 800/600XL's with the cartridge sticking out of the top where any 4-year old could knock it out of place? Why didn't they cover the cartridge slot up as they did with the 400/800, unless it was safe to remove/insert cartridges with power on?

This reasoning does not, as you see, apply to the 400/800, since the cartridge door normally powered off the computer before you could insert/remove a cartridge; however, from personal experience, I've done it with no problem.

On the other side of the coin, an old issue of "Creative Computing" had an "Outpost: Atari" column about this same subject. I only saw the article briefly, so I can't remember if it was talking about inserting cartridges with power on with the XL series or with the old 400/800. Whichever it was, though, I remember seeing the words "potential," "spike," and "zap" in the article. To be honest, though, I usually took "Creative Computing" articles with a grain of salt. I had a bad experience building their light pen and diddling with it for weeks before deciding it simply didn't work. Years later I happened upon the correction article in the library while browsing back issues of the magazine. Sigh.

(shrug) Believe what you will, and use at your own risk...

Source record: 110458

In article <61793@cup.portal.com> Rick writes:

```
|
| Congrats on the 1702, I've had one for years & it's never skipped a beat.
| From Mapp'n the Atari, looking at the connector from the back:
|
| 3 1
| 5 4
| 2
| 1=>composite lum
| 2=>ground
| 3=>Audio
| 4=>composite video
| 5=>Composite Chroma
|
```

Fine, except the 800XL didn't have a Chroma (pin 5) signal hooked up.
You then had two choices...

1) Reroute the jack from composite video (pin 4) to the Chroma input.
Simple, but don't expect terrific results.

2) Build a real, working Chroma (pin 5) signal. Here's one that's
worked quite well for me...

```
3 1

5 4 R 64
| +--/\/\/---....
| 2 .01 mF |
+-------------------------||-------+
| R 97
+--/\/\/---....
```

Attach a ceramic disc capacitor to the spot where R64 and R97
are connected. Then attach the other end of the capacitor to
pin 5 of the monitor jack. (I bought one from Radio Shack,
part no. 272-131)

Hope this helps,
Rich K.

Sparta DOS X uses this area. SDX is probably the best DOS I have ever seen
for any PC (except UNIX or *maybe* OS/2). SDX uses this area a lot to bank
the Cart. and access its built in CAR: device. If ICD would ever relese
any specs., people would be able to develop software that remained compatable.
Frankly.... My Atari 800xl _became_ a PC when I obtained SDX.

(Sorry, I don't have access to private mail)

In response to your question on finding the public domain software only 80column terminal emulator Term80, for the Atari 8bit:

I'm really not certain what Atari 8bit files are available through the network. One source for Term80 is the St. Paul Atari Computer Enthusiasts (SPACE). It is available as one of the club's Disk of the Month. You can contact SPACE very easily via their BBS at 612-488-5973.

The software requires an 800XL with at least 64K or newer machine. The disk also includes Read80, which allows the user to read ASCII text files, which have been "printed to disk" with no more than 80 columns per line, on the screen.

Although both of the above are software only packages, a composite monochrome monitor is needed for legible 80 column text. Most televisions or color monitors will be too fuzzy.

I once had a Recoton 5-pin monitor cable which had pinouts to both a chroma and a luma input...but unfortunately, I lost the cable. Since I've been reading c.s.a.8, I've revived my flagging interest in the Atari, and as a result, I'm looking for a monitor cable, preferably for a chroma and luma connection, although I'll settle for the old CX17 (I think) cable if I can get one. I just need one...

Thanks in advance...

2722. Function Keys

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-13 12:04:10 UTC
From: Jeff McWilliams <JJMCWILL@MTUS5.BITNET>
Message-ID: <92195.070410JJMCWILL@MTUS5.BITNET>
Source record: 110471

Someone asked for me to post the 1200XL function key upgrade modification for XL/XE computers, so here it is.

This is from Michigan Atari Magazine, October 1987.
By Charles Cherry, reprinted from ABACUS, August 1987.

You all know that I love to cut up my computers and solder in all kinds of weird things. To me the word hacker refers to violent physical activity. I know that not all of you feel the same way. You like computers that work. Well I've found the perfect modification for XL and XE owners to get their feet wet.

I was reading a letter to the Editor of Current Notes (the newsletter of the Washington, D.C. area users) from Roger Tolbet of Ozark, Alabama. It seems he grafted a 1200XL keyboard into an 800XL and discovered the 800XL operating system supports the 1200XL function keys! "So what," I hear you say. "No one ever wrote any software for the function keys." True. But the function keys do some pretty interesting things all by themselves. Like controlling the cursor. No more holding down the control key. I immediately opened my brother's 256KXL (formerly an 800XL), drilled four holes in it for push buttons, and wired them in.

It works like a charm. This is something I have to have. Guess what. It works on my 320XE (formerly a 130XE) too. Here's how to do it.

Get four normally open push button momentary switches (Radio Shack 275-1547 -- $2.69 for 4). Decide where you want to put them. I put them in a diamond shape above the CONSOL keys of my brother's XL. I put them on the side of my XE. Open up your computer and take off the metal RF shield. Install the buttons. Find U24 and U25 on the XL. I don't know the chip numbers on the XE, but they are easy to find. They are 16 pin chips and are near where the keyboard connector attaches to the motherboard. They should say 4051 somewhere on them. Use the one closest to the front of the computer as U25 and the one behind it as U24. Wire the buttons as follows:

Button U24 U25
Up 1 4
Down 12 4
Left 1 5
Right 12 5

[I did this on a 600XL, and moved from pin 12 to pin 13 on U24 to make it work... Jeff]

(each button connects to both chips. One contact connects the indicated pin on one chip, the other contact connects to the indicated pin on the other chip.)

This is a real easy project and the rewards are great. I encourage you to try it.

[See either the 1200XL addendum to the Atari 400/800 Technical Reference Notes, or the revised edition of Mapping Atari for details on what the function keys do. In Mapping the Atari, see the XL/XE Appendix under memory location 96 and 97.

Does anyone have a copy of the article to graft a 1200XL keyboard onto an 800XL?

Jeff
]

2723. ANTIC & a question

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-13 12:04:54 UTC
From: Jeff McWilliams <JJMCWILL@MTUS5.BITNET>
Message-ID: <92195.070454JJMCWILL@MTUS5.BITNET>
Source record: 110472

Does anyone have specs on the Antic chip?

What I am wondering is this:

Most public domain memory upgrades don't allow for true 130XE compatibility. What I mean by this is that you can't tell just the Antic chip to see the extended memory, or just the CPU to see extended memory. The two implementations I've seen are as follows:

ANTIC always follows the CPU... RamboXL and other PD upgrades

ANTIC always sees main memory...Newell with optional switch installed

What would it take to design an upgrade which was truly 100% XE compatible in this regard. I am actually thinking of using a second PIA for BANK control, but the hardware design would be the same as if it were done as $D301, just that I would have more bits to select, and thus more banks available, by using a separate PIA port. Of course, it also means that RAMDISK handlers would have to be patched, etc. No big deal, just replace the occurrences of "$D301" with "$D3xx".

I know that Antic takes over the BUS via DMA control to access the display list and screen memory, so is there just like a DMA line that can be watched, and then LOGIC designed to watch for either CPU or Antic memory access, and depending upon the Address range, and the setting of the CPU Bank Enable Bit and Video Bank Enable bit; make sure that the propery memory appears on the bus?

On a further note, are there any articles that go into the theory of how the standard 256K upgrade works? Like what the pinouts are of that MMU chip that the RamboXL and other PD boards plug into, and how the signals are used to produce a 256K upgrade. I've seen the original Claus Bucholz article entitled "The Quarter Meg 800XL" from Byte Magazine way back when, but not even it goes into how it really works, so that somebody could modify or improve upon it. Perhaps having a SAMS manual or something would be of help to me, but at moment I can't afford to pick one up, and they are probably going fast.

I don't have any kind of reference handy. I always thought the 5-pin DIN
connector offered: chroma, luma, composite, sound, and ground. Is this
true? If you do in fact have separate chroma and luma output, how simple
would it be to connect it to the SVHS input of a VCR? Has anyone done this
already?

```
It has been a very long time since I've been looking at the
VBI code, but I'm not sure if calculates any checksums to
check if a cartridge has been inserted.
All I remember is just writing a non-zero and non-$FF value
to the address where the cartridge is expected.
Then the OS simply reads the same location and compares it
with the written value. If it turns out to be the same
than you've RAM and no cartridge. You can't change somethig
that is written in ROM.

It would be like the following:

LDA #$AB ;just a random value
STA $8000 ;cartridge area (not sure)
CMP $8000 ;check if STA changed something
BNE CARTRIDGE--> ;cartridge inseted
.
. ; else
.

This is at least the way _I_ would do it.

It doesn't take much time.

Exactly - in other words, it's a configuration problem. Reducing the
UNIX machine's output buffer and/or increasing the Atari's input buffer
should do the trick.

My, aren't we being elitist?

>If you log into a machine many times you are displaying information
>you have already read (Menus and such) ans at 2400 it can be a PAIN.

Is this your personal definition of "useful?" If so, it's a rather
limited one. Hoo-Ray for you if you can afford a 16.8KBPS modem
(although if you're using it on an Atari I doubt you're using the full
bandwidth the modem is capable of), but the vast majority of modems in
use today are still 2400BPS or less.

The Apple boards are 3"X8" with a 34 pin connector comming off it. Not that I'm being indecisive or anything, but like I said, one of my buddies that works for a IC test equipment manufacturer says minimum run on a PC board would be $500. A 62 pin device makes a lot of sense, you could even use AT type boards with the extra 36 pin connector for I/O. It's just the price thing that has me down. I've got PC Board designer, but never really got good at using it. It might not be a bad idea to put a couple of weeks into learning it so photo copies could be sent out for a nickel each, but still: I think people would balk at spending $30 for a blank WW board. I was just trying to keep the cost down to the point where everyone who wanted one wouldn't think twice about cost. What we seem to have here is one guy trying to do it right & another trying to do it cheap <grin>. BTW: I picked up an extra 1772 disk controller by mistake. This is the same puppy that is in the ST & XF551. Set me back $25, but if you want to try to wire it on the bus, you welcome to it. I don't have any docs for it, the only ones I've seen are the Abacus ST stuff for about $25. I'm going to send in for the ST developer kit so I'll get some more info but not much. Anyway, if you have info sources, you may want to try it. I KNOW I won't get to it in the next year. But then you don't have a buss do you?

>Display the binary data as disassembled code, ATASCII, bytes, or words. The
>user can mark a range and define it as one of those types, and that info is
>also added to the symbol table.

Here's what I have so far:

The disassembler allocates a full 64K chunk of memory for the entire Atari address space (this may seem wasteful, but will be important for later stages of the project). Several lists are set up: a location list (for the targets of branches, jumps, and subroutines), a data list (for the targets of loads/stores/other memory accesses), and a range list (containing information on which address ranges are code, which are data, etc.) Each chunk (for want of a better term) in a binary load file is read into the 64K memory image buffer (MIB), and the INIT and RUN addresses are inserted into the location list.

The way the disassembler works is to take an address from the location list and trace through the code beginning at that point. As each instruction is encountered, addresses are saved either in the location list (if they are JMPs, JSRs, or relative branches) or in the data list (if they load, store, or manipulate memory contents as data, such as LDA, STA, EOR in absolute mode, etc.). When a JMP, RTS, RTI, or similar instruction is encountered, that is considered the "end" of that particular block of code. Execution tracing stops at that point, and the range of addresses just traced is added to the range list. Note that all the lists only add addresses or ranges if they are unique; thus, if there are seven places in the code which jump to one particular address, that address will only appear once, not seven times.

Once a particular address has been traced, that starting address is flagged as "used" and the next unused address in the location list is used as the starting place for the next call to the trace routine. This is repeated until all addresses in the location table have been traced. The end result is a range list containing a series of known code ranges, as well as a data list of known data locations. The last step is to generate the actual assembly language source output, which generates either instructions or .BYTE/.WORD pseudo-ops depending upon whether the address falls into a CODE or DATA range. Note that the location and data

tables also contain labels for each address, and that these tables may be pre-loaded with meaningful labels for common locations. When the assembly language output is generated, these labels are inserted in the listing automatically.

That's the plan. At this point, I'm working on range collisions, i.e. what to do when you have ranges which overlap in the range table. Due to the way most assembly language programs are written, as well as the way the disassembler traces code, there will be many ranges which overlap. These overlaps should be resolved into either merged ranges or split ranges. I haven't come up with an efficient way to do this yet, but I'm working on it as I find the time. I do have the disassembler and code tracing portions working now, as well as some code to read binary load files (thanks to the person who posted the information here a couple weeks ago). If anyone has any suggestions on the code range problem, I'd love to hear them.

BTW, the range data structure is as follows:

```
// ADDR is a 16 bit 6502 address
struct range {
ADDR start_address;
ADDR end_address;
byte type; // range type, e.g. CODE or DATA
};
```

I need to a) detect and b) resolve overlapping ranges of possibly different types, e.g.

```
start_address = $0600
end_address = $06FF
type = CODE
```

and

```
start_address = $0610
end_address = $06FF
type = CODE
```

When the second range is added to the range list, the insertion code should detect that the ranges overlap, and further that the new range is a subrange of the existing one and not add the new range. If, on the other hand, the second range is already in the list and the first range is added, the insertion code should "know" that the new range is a superset of the existing range and extend the existing range accordingly.

Other problems crop up with various combinations of ranges, especially when they are of different types (i.e. if overlapping ranges are of different types, which type should have priority?)

I hope this is clear to those interested enough to read this far. If not, just ask and I'll attempt to clarify. ;-)

2737. Re: Writing A Disassembler

Newsgroup: comp.sys.atari.8bit

Not quite sure if you covered this indirectly, but what if you have some
code like this:

```
BEGIN LDA DOSINI
STA JMPDOS+1
LDA DOSINI+1
STA JMPDOS+2
LDA #OURPRG&255
STA DOSINI
LDA #OURPRG/256
STA DOSINI+1
RTS
OURPRG NOP
NOP
JMPDOS JMP $0000
END
```

I think I got that right, it's self modifying code, putting the OURPRG
routine into the RESET vector, and putting the old vector address into where
JMPDOS sits, so that after our routine executes, it resumes executing
the regular DOSINI routinens. Not sure If I got the ADDRESS&255 part right,
but hopefully you get the point I am trying to get across. Now since
the assembler will see JMPDOS being STA'd to, but it also has a JMP there,
will it consider it code or data? Same with OURPRG. Although it may look like
data at first, to a disassembler, since you are only storing its address
somewhere, there is actual code there. Don't get me wrong, not trying
to put down your efforts or anything, quite the contrary! I just
wondered if you have decided how to handle such cases. I guess
disassembly can be pretty ugly.

That's an excellent question. My hunch is that code ranges should have higher "priority" than data ranges, so that when there is a conflict, the code interpretation will take precedence. This is as it should be in the case of self-modifying code.

As long as SOME known starting address eventually leads through the self-modifying section, the address range will be interpreted correctly as CODE (although the instructions in that section may or may not generate the proper disassembled instructions without some manual tweaking).

>I guess disassembly can be pretty ugly.

Yeah, but this project is turning out to be a very interesting one. Already I've learned more about the 6502 instruction set than I ever wanted to know. BTW, I seem to recall that there are some undocumented "instructions," i.e. opcodes that are officially undefined by MOS but nonetheless do various semi-useful things when the processor executes them (bizarre combinations like "exclusive or the following absolute address with the accumulator, rotate the result through the carry by 4 bits, and copy the result from the accumulator to the flag byte" or something equally strange). Anyone have any pointers to more info on these? I doubt if they're worth supporting, but I'd be interested to learn more about them.

have you looked at how some of the ibm disassemblers handle
this? The ones I've used usually have the user set the
block types, and allow for dumping in ascii or hex to
assist in determining the type for each block. they also
generate different labels for code references and data
references. I haven't seen one that tried to do it all
automagically. It sounds like a cool project, and it'll
be interesting to see what you come up with.

>learn more about them.

These opcodes were documented in COMPUTE! way back when (1983?). They
are usually combinations of various instructions, like loading both the
accumulator and y register at the same time. And there are
nonsensical addressing modes for some instructions, along the lines of
"STA #imm". IMO they look like side-effects of the hard-coded design of
the 6502. That is, *every* byte loaded as an opcode will do something,
but only some of them were given actual names. If you study the
numerical organization of the instruction set, you can predict what
the missing instructions will do.

Supporting these instructions is probably not a good idea because they
don't exist on the 65C02 used in later machines. (Too bad the
800 didn't use a 65C02. I really liked the extensions, especially
"LDA (zeropg)"

This assumes, however, that "no cartridge" is equivalent to "RAM in $A000-BFFF." On the XL series, no cartridge usually means built-in BASIC in $A000-BFFF (unless OPTION was held down during boot). Yet, the computer does detect when you insert a cartridge, which replaces built-in BASIC ROM with different ROM. It seems that a checksum of some sort is being calculated.

I have Atari's Battlezone XE cartridge and it runs fine on my 800. So I bought Crystal Castles XE and nothing happens, blank screen. So I returned the cartridge and asked for a cartridge that they have verified to work and they gave me one they verified but it doesn't work. So this brings me to the question: do all XE cartridges run on the 800 and if not which ones don't? Also does anyone want to buy this Crystal Castles (Airball type) game for $11 postage paid?

2748. 1450XLD and disk drives

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-14 08:54:27 UTC
From: mfolivo@sactoh0.sac.ca.us
Message-ID: <1992Jul14.085427.12880@sactoh0.sac.ca.us>
Source record: 110495

The 1450XLD had a metal case, so that you can rest a monitor on top of it. It also had a built-in double-sided, enhanced density drive, with a shielded bay for disk storage, or the installation of another drive.

A few trivia points...
The disk drive was a faster parallel drive, as opposed to the serial drive that everyone has.

The double sided drive was WEIRD, that one side was D1:, and the other side was D2:. (To maintain compatibility with the older drives?)

DOS 3 was designed with the XLD in mind, you can see it in some of the menus for copying files and duplicating disks. (I still use DOS 3 exclusively)

The 1450XLD also had a built-in 300 bps modem, and speech synthesis.

The 1450XLD can be regarded as one of Atari's Holy Grails for collectors, the other the equally elusive 815 double disk drive.

I remember reading in ANALOG's "Video Game Digest" years ago that
many later Atari cartridges were designed for the XE/GS and wouldn't
work on the 400 and 800. This is presumably because they use the
RAM hidden underneath the OS ROM. I can tell you for sure that
XE Ballblazer works on the 800. I think there *may* have been
problems with Food Fight and Barnyard Blaster, but I never tried
these games for myself.

Sourcer is the IBM disassembler which serves as the model for ReSource/65 (my disassembler). Sourcer can start with nothing more than the executable, and will generate a definition file automatically along with the assembly language listing. You can go in with a text editor and tweek the definition file, then run the disassembler again in an interative fashion until you finally get a usable source listing.

My goal here is to have the disassembler make a "best guess" as to which ranges are code and which are data, and allow the human to override this later if necessary. Same with the labels for code and data locations: external references (such as OS calls) will have predefined labels, but internal references will have generic labels generated automatically by the disassembler which can be replaced by a human with more meaningful ones in the definition file. The next pass through the disassembler will then incorporate the new labels into the output.

Just out of curiosity, how many of you out there have IBM PCs in addition to your Ataris?

Yeah, that makes sense.

>Supporting these instructions is probably not a good idea because they
>don't exist on the 65C02 used in later machines.

I doubt I'll add them to the disassembler's opcode table, but there might be some situations where adding a comment to the code might be helpful, i.e. there is an address which is known to be within a block of code, but still is an undefined opcode and is not the target of any known memory access, perhaps the disassembler should generate a .BYTE pseudo-op along with a "; Loads accumulator and Y simultaneously" type comment. This is definitely one of the lower priority features, however. ;-)

I do, but for some reason the PC just isn't as fun--I can't put
my finger on why. Perhaps it's the feeling of "one person can
make a difference" and the more tightly-knit user community
in the Atari world.

Owning a PC has definitely reminded me how far ahead of its
time the 800 was. And that a computer system is exactly
that, a system, and not a collection of independent parts.

Mark,

Well, as you expected, I agree on all points except using DOS 3.
For me, it's SpartaDOS X or 3.2d, then Mydos 4.5 1M in order of preference.
DOS 3 I never really did like, and I think I formatted my DOS 3 disk for
something or other. DOS 3 left you stranded with their custom disk format,
as did, I believe, DOS XE. WHen I first got DOS XE, I was rather excited,
but I discovered it was quite confusing to use and so it went into the archive
box.. along with a non-official of OS/A+ and other DOS oddities.

The parallel drive feature is the most interesting in the 1450XLD.
This would make I/O awfully fast. Ben Poehland recently commented
that his 1.44 meg floppy drives on his Black Box are really fast as well,
again, partially because the data goes through the parallel bus.

I also have an old 600XL but I'm still stuck with 16K. I'd love to upgrade to 64K, but I don't know how to perform the upgrade that Ben suggests. Is this something a novice could do? I would highly appreciate any help or a suggestion as to where this might be documented.

Thanks,
Brian Casey

2759. WANTED: Atari, Colecovision, Intellivision carts - buy/trade

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-14 21:27:54 UTC
From: bs066@cleveland.Freenet.Edu
Message-ID: <1992Jul14.212754.25692@usenet.ins.cwru.edu>
Source record: 110357
Cross-posted to: rec.games.video,misc.forsale,misc.forsale.wanted,comp.sys.atari.8bit,misc.forsale.computers

*** Wanted: Used/new Atari 2600/5200/7800 games, Intellivision,***
*** Colecivision and XEGS/Atari computer cartridge games. Will***
*** trade new/used/rare games or buy games. ***

Wanted: Atari 7800/5200/2600, Intellivision, and Colecovision video
game cartridges. I would like to trade/buy games. I can get new
2600/7800 games at some local stores and would like to trade those
for games that I do not have.

I will also pay a reasonable price for the games (depends on
the game) and pay shipping.

Please send me a list of the games that you would like to
trade/sell and what games/price you would want.

I am no longer just just selling games. It ends up being too much
of a hastle and too many people decide at the last minute (after
I have already bought the games) that they do not want the games.
I may change this for special reasons though. E-Mail me.

Here is a list of the games that I have available for trade for
2600/5200/7800, Intellivision, and Colecovision games. (All of
the 2600/7800 games are new, in the boxes, come with manuals, and
most are still shrink-wrapped) I also have a small number of used
games without manuals or boxes. Ask for particular titles if you
are interested. The normal used games are $1-$4 each. I also
have a few rare titles for trade only. If you are interested in
trading, E-Mail me and we can swap lists of games for trade.

New Atari 7800 games for trade:

_____
Ballblazer Tower Toppler Donkey Kong (Rare)
Donkey Kong Jr. (Rare)Joust Dark Chambers
Pole Position II Asteroids One-on-One Basketball
Centipede Robotron 2084 Crossbow
Xevious Choplifter Karateka
Dig-Dug Hat Trick Realsports Baseball
Jinks Galaga Impossible Mission (Rare)

New Atari 2600 games for trade:

_____
Desert Falcon Q*bert Gravitar
Pole Position Venture Sprint Master
Super Football Jungle Hunt Centipede (Rare)
Crossbow Crystal Castles Super Breakout

Battlezone Jr. Pac-Man (Rare) Solaris
Millipede (Very Rare) Kangaroo R.S. V-ball(VeryRare)
Secret Quest Space Invaders Asteroids
Ms.Pac-Man Vanguard Dark Chambers
Pheonix (Very Rare)

New XEGS games for trade:

Rescue on Fractalus Archon Ball Blazer
Gato

The ones with (Rare) next to them are ones that I have seen, but in limited quantity (should still be available, but may not be). The ones with (Very Rare) are so rare I have only seen them at one to two stores, but may be still available (no gaurantees). All games are new and in the box with manuals.

I can also upon occasion come accross NEW 7800s and 2600s at very reasonable prices. Mail me if you are interested but I can make no guarentees. Prices are $25 for a new 2600 with 1 joystick, $45 for a new 7800. Used systems also available:

Used Hardware for Trade/Sale (Shipping not included)

Systems:
Atari 2600, 2 Joysticks, 1 set of Paddles, Power Supply, Switch box, $25
Atari 5200, 4 joystick port, power, switchbox, NO CONTROLLERS, $25
Atari 7800, 2 Joysticks, 1 set of Paddles, Power Supply, Switch box, $35
Parts:
Atari 2600 Console, $15
Atari 2600 power supply, $5
Atari 5200, 4 joystick port, console only, $10 (works as far as I know)
Atari 7800, Console only, $20
Atari Driving Controllers, $10/pair

Used SNES games available for trade only

PilotWings
R.P.M. Racing
Super Ghouls and Ghosts

I am also interested in used video game hardware (anything but Atari 2600/5200/7800 mainly). Please also send a list of what you have and the prices.

Here is a (partial) list of the games that I am particularly looking for. If you have any of these games for sale/trade, please write back and we can make a deal.

Atari 2600 games wanted

I'm looking for information on the internals and programming the
Atari 2600 and 7800.

This information is needed by a friend of mine that is attempting to
create a 2600 emulator for the Amiga Computers. If anyone has any
information on both programming and any internal information on the
2600/7800 it would be appreciated.

Please mail the information/pointers to the information to me at this
address.

Also since this project is in the infancy, anyone with any comments,
suggestions, etc., please send those too. The messages will be passed
onto the programmer.

Thank you,
Jeff Scott

My Atari has served me well for many years, but it's time to move on.

1 Atari 800XL computer (64k)
2 Atari 1050 disk drives (unmodified)
1 Citizen 120D dot-matrix printer
Sony color TV

Lots of software, including AtariWriter + (the fastest and easiest
word processor I've used on *any* system)
Lots of books, including De Re Atari and Compute!'s Mapping The Atari

Still a great machine for word-processing, programming, and games.
Yours for $250 or best offer. Call Jake at (415) 491-4526 or reply
by email to 'jaked@well.sf.ca.us'.

2762. Atari XL/5200: Bounty Bob Strikes Back cheats wanted

Does anyone have any information about the special codes
option for Bounty Bob Strikes Back (By Big Five) for the
Atari 8-Bit computers and the Atari 5200?

Any cheats/level warps, etc?

I remember that there was one in Miner 2049er that would allow
you to warp to any screen after typeing in the phone number of
Big Five. Is there anything simular for Bounty Bob?

Thanks,
Jeff

Message-ID: <1992Jul15.062438.7629@news.iastate.edu>
Source record: 110361

In trying to send graphics data to a printer, I beleive
the P: handler converts $9b (eol) to a $d (CR), messing
everything up. Is there a simple way to turn off this translation;
such as special aux1, or aux2 values when opening the P: device?
Alternately, I tries using the sio vector directly, but
couldnt get it to work. (tho Ive done things that way with the
disk drive) Any suggestions on this angle?
Should I just write my own handler?
Please, take the time to educate this poor fool.

Paul

ps. If it will help facilitate any explaination, Im writing in
assembly and using the p:r: conection.

What you might want to consider doing, instead of adding the undocumented opcodes of the 6502, is add the opcodes for the 65C02. I do believe that chip could be placed in an 800 computer. Actually, I would love to also see a disassembler for the 65802 and 65816, but that is much bigger project, due to the added addressing modes, and 16 bit registers. Still, if you are one who likes challenges, there is a definite challenge.

Source record: 110369

Rick,

Not sure you addressed your last reply to, I don't THINK it was me.

3x8 is not too bad a size, I think I was looking at a board from Digikey that measured 4.5x8 and had 3-hole solder pads and busses. It was $12.41. I was gonna use something like that for doing 4 PIA's and some other stuff in a 1200XL. Looks like I won't be doing that anytime soon though. What I like about some of the PC cards, is that there are spots laid out for DB type connectors to be soldered in, or header type connectors, making it easy to put in a DB15 or DB25 if you wanted to do an RS232 or Printer interface board. Unfortunately, these boards are quite a bit more expensive, and would require the IBM type connectors be located on a main board that the extra cards plugged into.

In one of the specs for the 1090XL, they were proposing that the Parallel Bus had three signals coming out of it, one for each of the pages where hardware would normally be located, D1xx, D6xx, and D7xx. I think this would be a good idea to implement in the proposed PBI standard we are talking about here. Additionally, the PBI has CAS and RAS outputs, do we need those? Personally, I would use Static RAMS not DRAMS in any homebrew hardware, so I wouldn't find these signals useful.

Just was in touch with National and Motorola. I am getting data on their respective UART devices.

Jeff McWilliams

I'm looking to set up my old 8-bit system again and need a disk drive since my old Percom is broken. I need something that can read and write SS/SD disks since I have a large library of them already, so I'd like a 1050 or Indus GT. Please send e-mail about the drive and I'll make an offer. I'm willing to negotiate on price depending on brand, modifications, etc.

Also, If anyone has an old IBM PC single sided 360K 5-1/4" disk drive mechanism, I'd like to buy one of those too, because the Percom controller is still good and I can get the drive running again by swapping the mechanism in. I'd be willing to pay in the $20-$25 (delivered) range for one of these units.

I'm looking for an RS232 interface, as well, either an 850 or P:R: connection would do I guess. I'm only willing to pay in the $30 (delivered) range for one of these.

And finally, are there any commercial vendors of mail-order 8-bit equipment and information still out there? Is there a list of this information available?

True.. but also true is the fact that just from the size compared to
what they can do you can tell that IBM programs are written VERY
inefficiently.. Look at BobTerm. I've yet to see a better terminal on
an IBM! :)

My Teknika MJ-10 Color Composite Monitor is starting to bite the dust and I would like to buy a new one. The thing is that I want a Composite Monitor that still has seperate Chroma-Luma video inputs like this one has.

The question is: Do people still make Composite Monitors with seperated video? What makes are out there? And where would be the best place to go to buy one??

Most PC stores only have RGB these days, and audio/video stores only seem to have the one video In jack. I guess I am just not looking in the right places if they are still out there.

Thanks for any help!!

Yeah, there is... only I can't remember it right now!
At least on the 8-bit version of the game, if you manage to
play through enough screens, the game itself will present a
screen of info telling you what to do in order to skip past a
few of the lower levels. Note that this is only good for elim-
inating the monotony of having to play through all of the same
levels each time you start the game; I don't know of any way
to choose levels indescriminately, the way one could, as you
described, in Miner '2049er.

I suspect there are other helpful things in the game,
but I never managed to play through enough levels to find them
all.

Sorry I can't remember the method for skipping the low-
er levels; it's been a long time since I played!

Do you mean you're trying to print Atari graphic characters or just send
graphic data to the printer? Assuming you have a printer that does graphics,
most early Atari printers did not support them. It's been done a number of
times for listing programs. I don't have a copy, but you might check the
archive or maybe someone will send you one. The technique for doing any
graphics is pretty much the same. You send the printer:
CHR$(27);"K";
followed by the line length in two bytes, i.e. for 8 dots wide
CHR$(8);CHR$(0);
Now you have to translate the character to 8 bytes of VERTICAL data:
byte #
12345678
00000000
00011000
00100100
01100110
01111110
01100110
01100110
10000001
so depending on your printer, the 1st byte sent would either be a 1 or a 128.
The second, hmmmm, 32+16+8+4+2. All as a single string. Some printers have
the top starting with a 128, some have it as a 1.

2775. Want to BUY someone's atari

My atari died the other day. (That's ok, I have another, but I like to have 2 around the house in case the other one ever goes.) I'd prefer an 400 or 800, (As that is what died, and my other machine is an XL) but i'd consider another XL.

They are fairly important to me as I run a bulletin board that has an atari section, and I like to check out the new uploads to the atari section.

I've seen a few posts for $250 etc. I'm afraid i'm NOT willing to pay NEW prices for these machines. Somewhere between $50 and $150 depending on what you are selling (machine with or without drives monitors etc).

Drop me a note if you have something to sell, or give me a phone call. My daytime VOICE number is 801-263-1840 x180 (ask for Jim Hood).

Thanks

What a silly idea. Since ALL of the software for the 2600 is on cartridge, there will need to be a cartridge interface built for the emulator. The cost for the interface, plus whatever shareware fees, etc. that the author plans to charge will probably be more than what you can find a real 2600 for these days. Sometimes I think the world has gone emulator crazy.

Hmm, seems the Digest is getting some feeds that my READNEWS isn't.

Regarding the Monitor question. Check out the Magnavox 1CM135
monitor. I believe it has like 3 different types of inputs on it,
including separated luma and chroma. I remember this monitor
because it was mentioned as being a good ST monitor as well, having
Analog RGB inputs on it. The resolution should be quite good, thus
having a nice display.

Please post your name next time, so I know who to reply to.

****

Paul,

Excellent question I am not sure where the translation is being
done. It may be done by the Printer hardware, or in the P:
handler itself. If it is in the handler you're bumming.
Compute's Third Book of Atari mentions this, and offers no solution
beside changing all 255's to 251's. Or avoid 255's altogether.
I believe this is what Roy Goldman did in Daisy Dot III, avoided
255 and another number, not sure which number that was though.
One of the benefits of doing a PIA modification and a printer port
on it: write your own handler, and be able to set whether 255 goes
through or is converted to the ASCII CR LF.

****
I got docs for a 64K 600XL upgrade from an old MAM here, I will
type it in and post it later, unless somebody has that upgrade that
was posted here way back in late 91 or early 92.

2778. Contra III cheat in July '92 GamePro...

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-15 17:58:28 UTC
From: dave@admiral.uucp
Message-ID: <1992Jul15.175828.9682@admiral.uucp>
Source record: 110377
Cross-posted to: rec.games.video,comp.sys.atari.8bit

There are two codes listed for Contra III in the July issue of Gamepro magazine
They read as follows:

"What strength! If you know the Street Fighter II Dragon Punch move, you can
pull off stage select and extra lives tricks in Contra III. To pick any level,
press Left, Down, Down-Left, Left and Start all in one motion at the player
select screen. Listen for the humming sound to indicate the code worked.

"If you'd like a thirty gun Contra Commando salute [I assume that means it
gives you 30 lives] press Right, Down, Down-Right, Right, and Start in one
motion at the player select screen. Listen for the death scream to indicate
the code worked. These tricks may take a few tries to execute properly, so
practice your thumbwork.

"Ryu and Ken S. Long, Thailand"

Now, try as I might, I cannot get these tricks to work. Could the problem be
that I do not know the Street Fighter II Dragon Punch move (blasphemy, you
say?)? Or, considering the attribution of that hint, could it just be so
much bullshit?

Can anyone tell me if they've managed to execute this bit of digital
dexterity, and if so, how I might be able to do so as well? Thanks...

>to also see a disassembler for the 65802 and 65816.

65816 disassemblers are a real pain. Opcodes can be interpreted
differently depending on whether the "mode bit" it set or cleared
at the time of their execution. Ick. (I only have passing
experience with the 65816, so I may be missing some details.)

BTW, the 6502 disassembler sounds like a fun project, Khan.
Good luck!

NO!! It has a 128-byte character set! The other 128-bytes are just the
inverse of them. I'm not positive about the IBM though. Maybe it TOO
only has a 128-byte chset. What about the Commodore? I remember reading
about some chset editor and it was saying how you need 2k lying around to
stick the redefined chset in. The 128byte Atari set only uses 1k.
Well?! :)

2787. SDX question?

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-16 05:07:05 UTC
From: a644690c@edinboro.edu
Message-ID: <0095DA2C83A78DA0.20600D9B@edinboro.edu>
Source record: 110380

This is a question for you ML people actually. I want to create a 'Hot-key'
to simply print the contents of COMTAB+63 whenever the key combo is pressed.
This location is the last line entered in the Sparta DOS command processor.
In effect, I want to simulate the MS-DOS F3 key which prints the last line.

I really don't know much about writing Handlers but I assume it should be
done like this (during the VBI?):

```
; COMTAB = contents of loc. $0A (word pointing to DOS entry routine vector)

Look at Keyboard Scancode. (loc. 764)
If Scancode = hotkey
pass COMTAB+63 to the E: device. ;for proper handling on EOL etc.
;I don't know if this can be done though.
ENDIF
Pass Scancode to the K: handler as usual to continue keyboard processing.
; The above line may not even be necessary is this routine is processed
; Before the OS Keyboard routine.
```

Does anyone think this would work. It would be really handy.
Oh, It HAS to be relocatable.

Thanks a lot......

Peace, | '...expanding exponentially
-Adam Conover | like some recursive virus...'
a644690c@edinboro.edu | -Phish.

PS. Could someone please reply to this that reads the IA8-digest exclusively?
(no c.s.a.8 access). I am wondering if anything I post actually makes it the
the Digest because I never see anything come back through. Just a not saying
you saw it would be fine. Thanks again!

2788. Still prefer DOS 3

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-16 06:24:54 UTC
From: mfolivo@sactoh0.sac.ca.us
Message-ID: <1992Jul16.062454.8331@sactoh0.sac.ca.us>
Source record: 110383

Well, I started out using DOS 3 from the beginning with the then
new 1050 drives. I only used DOS 2 for older programs that had a
boot sector loader menu. (DOS 2 format, that is)

For a single density format, I did prefer SmartDOS at the time.

When DOS 2.5 was released, I bought the disk and manual, but after
a while, reformatted the 2.5 disks with 3.

There were a few things that I had become accustomed to with DOS 3
that single density DOSes did not have, like the XIO 254 command.

After buying a single density DOS, and not wanting to pay to
upgrade the 1050 to double density (hell, just buy more disks)
therefore making the purchase of SpartaDOS irrevelant (SmartDOS was
a DD DOS anyway), I am pleased with DOS 3. It does the job.

I remember the old DOS wars, especially with th primary "reason"
against DOS 3; the use of 1024 byte blocks, but then again, no one
complains about hard disks and the size of their blocks, do they?

Another little feature about DOS 3, is that when you exit to BASIC,
and then want to get back to the DOS menu, boom, you're there. DOS
3 did not have to reload.

You might want to take over the keyboard interrupt, using
the vector at $208,$209 (VKEYBD). Then read the scan code
from KBCODE = $d209, which is the hardware register for the
keyboard. check for your hot key, and call the original
interrupt handler if its not your hot key.
Now, if SDX has one of those type-ahead buffers, that would
be the place stuff your command line into, rather than
using the E: handler (I think). That'll be the fun part.

The IBM uses a 256 byte character set. There are special codes for inverse, blinking, etc (making you use TWO bytes/character.) The C64 uses a 256 byte character set as well. The 64 also has two sets of character definitions in ROM. One has just uppercase with lots of graphic symbols (default) and the other is upper/lowercase. If the C64 character set is to be redefined you do need 2K to do the whole set. Usually, though, you just want to redefine the upper/lowercase characters and/or a few graphic characters (like in the game Centipede.) You only need as much RAM as necessary to redefine these characters (ie. If you only want to redefine one character, you only need 8 bytes.)

2791. Modifying NES lightgun for Atari 2600/7800 - need help

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-16 14:14:52 UTC
From: drudetb@infonode.ingr.com
Message-ID: <1992Jul16.141452.7547@infonode.ingr.com>
Source record: 110385
Cross-posted to: rec.games.video,comp.sys.atari.8bit,comp.sys.atari.st

Light guns for the NES are bountiful and cheap. Atari light guns on the other hand are harder to find and more expensive when you do find them. Does anyone have information on converting an NES light gun to an Atari 2600/7800/XEGS type? I think it should just be a matter of changing the connector from the NES style to a regular DB-9 female, and redirecting the wires to the proper pins. Unfortunately, I don't have wiring diagrams for either type of light gun.

Can anyone help me with this?

Thanks!

Toad Computers in Severna Park, Maryland will sell you one pretty cheap. I just picked an 800 up there for $39. (Not bad if you consider that the average PC video game is more than that.) They have loads of other 8-bit stuff, too, and they're very friendly. Call MD directory assitance to get their number and give them a call. (I'd post the number but I don't have it here.)

Adam, Todd has general hot read right, but I don't think it will work with
SDX because of the way the system uses the line input: It's really an I/O
buffer. Ergo if you type 'DIR' when SDX gets through I think you'll have
a <RETURN> as the 1st character in the buffer followed by:
XXX FREE SECTORS<RETURN>
SDX puts the 1st <RETURN> there to get you off the current command line &
onto a fresh one. You can access the line input, the vector is under ROM
& I think is just a JMP $920. It's just you have to set up the buffer before
you use it. It could be done copying the buffer to a safe place in ram after
each keystroke, "just in case
but it's a little more complicated then just executing the same command.

>

Okay, it was just a thought that I figured I would throw to the wind. I agree, with those mode bits, it's close to impossible to really know what mode the CPU is in, and therefore how many bytes get loaded into say, the Accumulator.
But the 65C02 is supported by Mac/65, so perhaps just these OPCODES could be supported.

>
>VERY TRUE!!!

Heh heh heh...

If BobTerm is so darned good, how come it doesn't run at 19,200bps? ;-)
;-) ;-) Oh, and does it support Zmodem? ;-) ;-) Will it emulate an
IBM3101 terminal? How about an H19, or maybe a VT220? How big a capture
buffer does it have?

Look, you're comparing apples to oranges here. BobTerm is great for what
it is, but trying to say that it or any other Atari program is "better"
than the IBM equivalent is just plain silly. There is no comparison.

>Do you know how long a program just writing "Hallo World"
>would become when programmed on an IBM-PC in Pascal-XSC?
>Guess...
>1KB? - wrong..
>5KB - wrong..
>20KB? - still wrong, it is more than 70KB (seventy!!!)

Clipper programs beat that hands down. Hello world in Clipper 5.0 is
over 270Kb (two hundred seventy kilobytes). The bulk comes from the
runtime overhead, which is linked in whether you use it or not. But lest
you bust a gut laughing at how "bloated" and "inefficient" IBM programs
are, let me remind you that these are only the worst examples. Don't
fall into the trap that your fellows over in comp.sys.amiga.advocacy
dive headlong into on a regular basis.

2800. Atari Corp. Cartridges

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-16 23:06:02 UTC
From: chase@electron.rutgers.edu
Message-ID: <Jul.16.19.06.01.1992.2281@electron.rutgers.edu>
Source record: 110398

I am trying to compile a list of all cartridges released by Atari for their computers. I am organizing the list by catalog number as listed on the outside of the cartridge. The following is a preliminary list.

CXL4002 BASIC Computing Language (version A)
CXL4003 Assembler Editer Computing Language
CXL4005* Video Easel
CXL4006* Super Breakout
CXL4007* Music Composer
CXL4008* Space Invaders
CXL4009 Computer Chess
CXL4010* 3-D Tic-Tac-Toe
CXL4011 Star Raiders
CXL4012 Missle Command
CXL4013 Asteroids
CXL4015* Telelink
CXL4018* Pilot Computing Language
CXL4020 Centipede
CXL4022 Pac Man
CXL4024* Galaxian
CXL4025* Defender
CXL4027* Qix
CXL4044* Basketball

RX8021 Caverns of Mars
RX8030* E.T. Phone Home
RX8031 Donkey Kong
RX8033 Robotron 2084
RX8036* AtariWriter
RX8039 Eastern Front
RX8040 Donkey Kong Jr.
RX8042* Tennis
RX8043 Ms. Pac Man
RX8044 Joust
RX8099 Ace of Aces

The ones with stars I have not verified, but have arrived at from the catalog numbers I found in a CMO closeout special (from Antic v.5, n.8). These numbers are unlikely to be wrong, but I can't check them.

The following I culled from memory and old ads. They might not be on cartridge for all I know, but if they are I'd like to add them to this list.

Xenophobe
Deluxe Invaders
Desert Falcon

Microsoft BASIC II Computing language
Star Raiders II
Dig Dug
LOGO Computing Language
Millipede
Pole Position
Pengo

I'd would like help completing this list. If you know of any other cartridges issued by Atari, and/or know the catalog numbers of some of the unknown ones, please send me an email message with details so I can update the list. Thanks.

Kevin Chase
chase@physics.rutgers.edu

>programming info? (Please? Pretty please? Grovel, grovel.) :)
>
A longish document describing 2600 programming info was posted twice to this
newsgroup, many moons ago. I thought I had saved a copy but I can't find it
now. What I briefly recall of it was that the 2600 used a 6532 processor (same
instruction set as a 6502, I think it's an integrated single-chip computer
with on-chip RAM). The system has only 128 bytes of RAM mapped in at page 0.
Aside from the incredibly cramped memory space, the gap at page 1 means that
you cannot use the JSR instruction, since there is no memory where the stack
would normally live.

While part of me looks at this idea and says "hey, that'd be a fun project,"
another part of me says "what's the point?" Since actual 2600s and carts are
already dirt cheap, I don't think anyone can really justify to themselves the
amount of programming effort required. But, that's just me. I sold my
ultra-cool Atari 800XL after I bought my first ST, and I've felt regret about
that many a time, but really, I couldn't justify (to myself) continuing to
spend any effort on such an outdated system when there was so much new to
explore on the ST.

Getting back to the 2600 - I find the lack of a stack to be greatly
discouraging. It would certainly have been quite a challenge to produce

meaningful software in such a system. Nowadays, I don't think the challenge offers sufficient reward to bother with.

I think you mean 155's (the ATASCII RETURN character); my printer prints
255's just fine. Anyway, yes, it is built into the handler <sigh>. It
converts all 155's to 13's. (It couldn't have been built into the printer
hardware (ATARI printers excepted), else the printer would do that with
ANY computer that it was hooked up to.) Another unpleasant "feature"
(IMHO) is a leftover from the ATARI 40-column printer days. If you send
ANY character after a RETURN, the P: handler will pad it out to 40
spaces! Very annoying for a program I was writing... I couldn't get
around it at the OS level.

VERY TRUE!!! Do you know how long a program just writing "Hallo World"
would become when programmed on an IBM-PC in Pascal-XSC?
Guess...
1KB? - wrong..
5KB - wrong..
20KB? - still wrong, it is more than 70KB (seventy!!!)

Imagine, just for writing "Hello World" to the screen. This program
wouldn't even fit into my 130XE (hehe) :)

Marek
(still can't belive, but it's true!!!)

2805. Quick

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-17 04:08:00 UTC
From: UJ1G@DKAUNI2.BITNET
Message-ID: <"92-07-16-21:08:45.96*UJ1G"@DKAUNI2.BITNET>
Source record: 110392

I don't remember exactly who was interested in Quick except Jeff
and Bill, so I decided to post the following to c.s.a.8

---

now, I've got the anwser from 'Power per Post' about ordering
and paying from abroad. Do you still remember? I've written a letter
to Power per Post asking about possibilities of getting
'Quick' , 'S.A.M.' etc.

Here's what they anwsered:

1. you have to send your order to

Power per Post
Melanchthonstr. 75/1
Postfach 1640
W-7518 Bretten
GERMANY

you do not need to know the ordering numbers nor the price. Simply
write what you want. eg. Quick, S.A.M.
Mention the type of your computer.

2. then 'Power per Post' will send a reply telling how
much you have to pay.

3. go to your local bank and get an international money-order

4. send your money-order back to 'Power per Post'

5. wait for the stuff to come

Ok, I admit it's quite a lot of work, but that's the way they want
to handle it.

I hope this helps

Marek Tomczyk

>instruction set as a 6502, I think it's an integrated single-chip computer
>with on-chip RAM).

Beep! The 2600 uses a 6507 CPU, which is basically the same internally as a 6502, but only has an 8K external address space and doesn't have any interrupt lines. It does have the RDY line which allows the CPU to be single-stepped by external hardware. The 2600 uses that line to synchronize the CPU to the TIA chip (tv interface adapter) which generates the actual video signals for the RF modulator. The CPU has to draw the raster lines in real time, however.

The 2600 does also have a 6532 RIOT (ram, i/o, timer) chip, which is a multipurpose peripheral chip. Very similar to the 6522 VIA, except it also has 128 bytes of static RAM. The RIOT provides the RAM, parallel I/O lines to the joystick ports and other switches, and a programmable timer which the CPU uses for all sorts of things.

>The system has only 128 bytes of RAM mapped in at page 0.
>Aside from the incredibly cramped memory space, the gap at page 1 means that
>you cannot use the JSR instruction, since there is no memory where the stack
>would normally live.

Beep! The RIOT is actually setup to decode its RAM at both pages 0 and 1. That allows the RAM to be both page 0 memory and the stack, and memory location $0081-FF are physically the same as $0181-1FF. You simply init the stack to the top of page 1:
LDX #$FF
TXS
And then you can safely use the lower part of the 128 bytes of RAM. You can address it as either "fast" page 0 RAM or with a full 16-bit address on page 1 (obviously).

>While part of me looks at this idea and says "hey, that'd be a fun project,"
>another part of me says "what's the point?" Since actual 2600s and carts are

As far as writing an emulator for another platform goes, I completely agree. The 2600 hardware is about as low as it can go (I think!) Hey,

I'll even sell a working console for $10.

>Getting back to the 2600 - I find the lack of a stack to be greatly
>discouraging. It would certainly have been quite a challenge to produce
>meaningful software in such a system. Nowadays, I don't think the challenge
>offers sufficient reward to bother with.

Well, there really is a stack in the 2600. But when it comes to
programming new games, I think the real challenge is getting a decent
game within the 6K code size limit. Of course there are ways to bank
switch, but that adds more complexity. As far as rewards go, you may
not get rick, but I think there's a sizable bunch of people who would
be interested in seeing some new 2600 games! (IMNSHO)

If memory serves, isn't XIO 254 the "format disk" command? That particular
XIO has been around forever, and is quite alive and well in DOS 2.

>I am pleased with DOS 3. It does the job.

As long as you're willing to accept being incompatible with virtually
everyone else in the Atari world, yes.

>I remember the old DOS wars, especially with th primary "reason"
>against DOS 3; the use of 1024 byte blocks, but then again, no one
>complains about hard disks and the size of their blocks, do they?

Hard disks' blocks are generally 512 bytes -- immediately HALVING the
"waste potential" per block compared to DOS 3 -- AND a hard disk is
much more capacious than a 5.25" floppy under ANY Atari density. These
two factors combine to make the individual block, sector -- even each
BYTE -- of storage MUCH more precious and "expensive to give up to wastage,"
as a percentage of the available disk real estate, on an Atari floppy than
on any hard drive. I'd be much more sedate about wasting 1024 bytes of
storage on even a small (10Meg) hard drive, than on even a double density
(~180K) Atari floppy!

>Another little feature about DOS 3, is that when you exit to BASIC,
>and then want to get back to the DOS menu, boom, you're there. DOS
>3 did not have to reload.

For which you paid the price of having less RAM available for programs and
data while in BASIC. But if that doesn't bother you, I recall SmartDOS could
be configured for exactly the same behavior. SpartaDOS X does the same
thing, for that matter, WITHOUT hogging up BASIC programming RAM!

BTW, your .sig misspells SACRAMENTO... ;-) Unless you really do live in
a place called SCARAMENTO...

2808. Re: Atari 2600/7800 programming info/specifications sought

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-17 04:30:49 UTC
From: Chris_F_Chiesa@cup.portal.com
Message-ID: <62258@cup.portal.com>
Source record: 110404
Cross-posted to: rec.games.video,comp.sys.atari.8bit

Here's some programming-the-2600 text that came off this Net a couple of years ago. I also have some source code which I'll post next. *383 lines*

Specifications for the Atari 2600/7800

2600 7800

CPU: 6507 6502C (custom, NOT 65C02)
RAM: 128 Bytes, in VLSI 4K, high speed
ROM: 6K max 52K max
Cpu Clock: 1.19 MHz 1.79 MHz
Graphics Clock: 3.58 MHz 7.16 MHz
Slot Config: Rom access only Most CPU lines + video/audio
CPU Avail: less than 50% over 90%

Notes:
1. ROM specs are based on a non-bank select scheme.
2. Graphics Clock is the master clock used to drive the video chips.

Programming the 2600 in a nutshell.
The Atari 2600 consists of 3 important ICs: the CPU (6507),
the Television Interface Adapter (TIA or Stella), and the RIOT (6532).
The 7800 has a CPU (6502C or Sally) instaed of the 6507 and a GCC1702
(Maria) chip in addition to the Stella chip.

The CPU:
The 6507 CPU is a 6502 with 2 important exceptions: it only has
external address lines for 8K of memory and there are NO interrupt lines
connected. This is not as limiting as it seems if you examine some of
the games for the machine.

The Stella chip:
This chip makes all the video displays and sounds for the 2600 VCS.
It also has 6 registers which are used as A/D converters and for the trigger
buttons on the joysticks. The chip also controls the RDY line of the CPU
to initiate horizontal syncronization control. The chip is NOT a DMA chip.
The CPU must write each line of data into the chip registers AS it draws
the screen. This accounts for the low CPU availability. The Chip is addresed
through 44 write only registers, and 13 read only registers mapped to
the low end of page 0. For those familiar with the Atari 800, this chip
is about 1/2 of a TIA/Pokey in all respects. But, there is no ANTIC chip to
drive it; the CPU must do all the work that the ANTIC does in the 800.

The RIOT
This chip reads all the console switches (excluding power), the

joysticks, and other controllers. It also contains the only RAM in the
system and a general purpose timer. The RAM is mapped to the high end of both
page 0 and page 1. This means that it acts as both page 0 fast access memory
and the 6502 stack. The timer and I/O ports are mapped to Page 2 and 3.

In order to produce a video display, a program must do the following:
1. Start the vertical blanking interval
2. Start the vertical sync interval immediately
there is time for about 80 instructions after this
3. End vertical sync
the game computations must be done now as there won't be time later
4. End vertical blanking
5. Set up each line of the video display as it is drawn
there is time for about 6 instructions to the video chip before
the current line starts being displayed. Atari recommends changing
the display every other line to gain processing time.
6. Loop back to step 1

The Cartridge:
A standard cartridge contains the equivalent of a 2716 or 2732/2532
with one notable exception: the chip select line is active high, not low.
The high order address line of the 6507 (A12) is used as the chip enable.
There was at least one company that used EPROMs with a 74LS04 inverter to
compensate for this.

The Pinouts:
Note: numbers indicate left to right numbering

Top Row Bottom Row
Slot 2716 CPU 2716 CPU

1 13 D3 1 A7
2 14 D4 2 A6
3 15 D5 3 A5
4 16 D6 4 A4
5 17 D7 5 A3
6 * A12 6 A2
7 19 A10 7 A1
8 NC A11 8 A0
9 22 A9 9 D0
10 23 A8 10 D1
11 24 +5V 11 D2
12 12 Shield Ground NC Ground
* to inverter and back to 18 for chip select

Major differences between 2600 and 7800 mode:
2600 mode is default in the 7800. If it finds 128 bytes at the high
end of memory to match its encryption scheme, it will enable 7800 mode. There i
s a small ROM inside the unit which displays the Atari pattern on screen as
it does this.
The 7800 mode is DMA driven, so the processor is free most of the time
to do other things, as the graphics chip runs 4 times faster than the CPU.

The 7800 cartridge slot includes 8 more lines: A13, A14, A15, R/W,
phase 2 clock, audio, video, and HALT (unique to Atari 6502).
The 2600 video has foreground/background, 2 player/missles, and one
ball. The 7800 can display as many objects as the DMA can read in one line.
The sound is exactly the same as it still uses the Stella chip
(except Ballblazer which has its own sound chip in the cartridge).

Wsync Wait for sync
This address halts microprocessor by clearing RDY latch to zero. RDY is
set true again by the leading edge of horizontal blank.
Data bits not used.

Rsync Reset Sync
This address resets the horizontal sync counter to define the begining of
horizontal blank time, and is used in chip testing.
Data bits not used.

Vsync
This address controls vertical sync time by writing D1 into the Vsync latch.
D1 - 1: start vertical sync
0: stop vertical sync

Vblank
This address controls vertical blank and the latches and dumping transistors
on the input ports by writing into bits D7,D6, and D1 of the Vblank register.
D1 - 1: start vertical blank
0: stop vertical blank
D6 - 1: enable I4 and I5 latches
0: disable latches - also resets latches to logic true
D7 - 1: Dump I0,I1,I2,I3 ports to ground
0: Remove dump path to ground

Pf0, Pf1, Pf2
These addresses are used to write into the playfield registers.

horizontal scan line map
(160 clocks, each bit =4 clocks)
Ctrlpf bit 0
bits 4-7 7-0 0-7 | 4-7 7-0 0-7
register Pf0 Pf1 Pf2 Pf0 Pf1 Pf2 0

bits 4-7 7-0 0-7 | 7-0 0-7 7-4
register Pf0 Pf1 Pf2 Pf2 Pf1 Pf0 1

Ctrlpf
This address is used to write into the playfield control register.
if bit is 1 then:
D0 - (REF) reflect playfield, see above
D1 - (SCORE) left half of playfield gets color of player 0
right half gets color of player 1
D2 - (PFP) playfield gets priority over players so they move

behind playfield
D5,D4 - Ball Size if 00, 1 clock wide
if 01, 2 clocks wide
if 10, 4 clocks wide
if 11, 8 clocks wide

Nusiz0, Nusiz1
These addresses control the number and size of players and missles.
D5,D4 - Missle Size see Ball Size above
D2,D1,D0 - Player number/size
if 000, X one copy
if 001, X X two copies, close
if 010, X X two copies, medium
if 011, X X X three copies, close
if 100, X X Two copies, far
if 101, XX one copy, double width
if 110, X X X 3 copies, medium
if 111, XXXX one copy, quad width

Resp0, Resp1, Resm0, Resm1, Resbl
These addresses are used to reset players, missles and the ball. The object
will begin its serial graphics at that time of a horizontal line at which the
reset address occurs.
Data bits not used.

Resmp0, Resmp1
These addresses are used to reset the horizontal location of a missle to
the center of its corresponding player. As long as this control bit is
true (1), the misslw will remain locked to the center of its player and the mis
sle graphics will be disabled. When a zero is written into this location,
the missle is enabled, and can be moved independently from the player.
D1 - 0: allow missle to move
1: lock missle to player

Hmove
This address causes the horizontal motion register values to be acted upon
during the horizontal blank time in which it occurs. It must occur at the
beginning of horizontal blanking in order to allow time for generation of
extra clock pulses into the horizontal position counters. If motion is
desired, this command must immediately follow a Wsync command in the program.
Data bits not used.

Hmclr
This address clears all horizontal motion registers to zero (no motion).
Data bits not used.

Hmp0, Hmp1, Hmm0, Hmm1, Hmbl
These addresses write data (horizontal motion values) into the horizontal
motion registers. These registers cause horizontal motion only when commanded
to do so by the horizontal movement command Hmove. The motion values use the

upper 4 bits of the byte. They are signed numbers with a +7 to -8 range. The
positive numbers indicate left movement, the negative indicate right.
Warning: These registers should not be modified during the 24 computer cycles
following an Hmove command. Unpredictable motion values may result.

Enam0, Enam1, Enabl
These addresses write into the single bit missle or ball graphics registers.
D1 - 0: disables object
1: enables object

Grp0, Grp1
These addresses write data into the player graphics registers

horizontal scan line map
(each bit =1 clock)

bits 7-0 if Refp0 (Refp1) is 0
bits 0-7 if Refp0 (Refp1) is 1 (reflected)

Refp0, Refp1
These addresses write data into the the single bit player reflect registers.
see above.
D3 - 0: normal
1: reflected

Vdelp0, Vdelp1, Vdelbl
These addresses write data into the single bit vertical delay registers, to
delay players or the ball by one vertical line.
D0 - 0: no delay
1: delayed

Cxclr
This address clears all collision latches to zero (no collision)
Data bits not used.

Colupb, Colup1, Colupf, Colubk
These addresses write data into the player, playfield, and background
color-luminance registers.
D3, D2, D1 - Luminance values 000 is dark, 111 is bright.
D7,D6,D5,D4 - Colors 0000 Grey
0001 Gold
0010 Orange
0011 Red orange
0100 Pink
0101 Purple
0110 Blue purple
0111 Blue
1000 Blue
1001 Light blue
1010 Turquoise
1011 Green blue

1100 Green
1101 Yellow green
1110 Orange green
1111 Light orange

Audf0, Audf1
These addresses write data into the audio frequency divider registers.
D4,D3,D2,D1,D0 - 00000 30KHz divided by 1
00001 " " 2
.....
11111 " " 32

Audc0, Audc1
These addresses write data into the audio control registers which control
the noise content and additional division of the audio output.

bits value noise type division
D3, D2, D1, D0 - 0000 set to 1
0001 4 bit poly
0010 /15 into 4 bit poly
0011 5 bit poly into 4 bit poly
0100 divide by 2
0101 divide by 2
0110 divide by 31
0111 5 bit poly into /2
1000 9 bit poly
1001 5 bit poly
1010 divide by 31
1011 set last 4 bits to 1
1100 divide by 6
1101 divide by 6
1110 divide by 93
1111 5 bit poly divided by 6

Audv0, Audv1
These addresses write data into the audio volume registers which set the pull
down impedance driving the audio output pads.
D3, D2, D1, D0 - 0000 no output
....
1111 loudest output

2810. 2600 programming

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-17 04:49:35 UTC
From: conklin@theclub.UUCP
Message-ID: <9207170449.AA15911@frith.egr.msu.edu>
Source record: 110407

Howard Chu @ JPL writes:

>"While part of me looks at this idea and says "hey, that'd be a fun project,"
>another part of me says "what's the point?" Since actual 2600s and carts are
>already dirt cheap, I don't think anyone can really justify to themselves the
>amount of programming effort required. But, that's just me. I sold my
>ultra-cool Atari 800XL after I bought my first ST, and I've felt regret about
>that many a time, but really, I couldn't justify (to myself) continuing to
>spend any effort on such an outdated system when there was so much new to
>explore on the ST."

Don't let Howard get you down. Go for it! He works with VMS programmers ;-)

Howard, if you really regret missing the 8-bit, I can get you started with
a 1030 Modem!

Terry Conklin "Honey, please don't go. Hell Awaits"
conklin@egr.msu.edu (Mixed quote, Muddy Waters & Slayer)

Paul somebody (a friend of Khan's I presume, he didn't sign his message ;-))
writes:

> In trying to send graphics data to a printer, I beleive
>the P: handler converts $9b (eol) to a $d (CR), messing
>everything up. Is there a simple way to turn off this translation;
>such as special aux1, or aux2 values when opening the P: device?

I encountered this same problem many years ago, using the Atari 850
interface. I remember trying to call Atari, back in the days when they still
have a customer support number (not toll-free; I made about a thousand calls fr
om NY to CA) but apparently just "busied out" the line during the day; I never
did get through. The translation I observed with the 850 was that EOL ($9B)
became CR+LF ($0D, $0A).

> Alternately, I tries using the sio vector directly, but
>couldnt get it to work. (tho Ive done things that way with the
>disk drive) Any suggestions on this angle?

I already had the OS Listing at that time, and searched through it to
look for the translation code, without success. I finally heard, SOMEWHERE,
from SOMEONE, that the translation occurred IN THE 850 INTERFACE, after the
data had left the computer proper, and that there was no way to disable it.
Obviously there was also no way to reprogram it. If you're observing similar
translation behavior using the P:R: Connection, that tells me one of three
things is happening: either the P:R: Connection contains some "intelligence"
similar to the Atari 850 and is doing its own translations too, or it
comes with a software driver that's doing the translation, OR what I heard
ten years ago was wrong and the translation is there in CIO itself, somewhere.
About your failure to use the SIO vector: did the I/O attempt simply FAIL,
or did it succeed but continue to experience translation?

If the translation is in the P:R: Connection driver, you ought to be able
to find it and patch a very few instructions and remove the translation
outright; note that this will make the driver incompatible with TEXT out-
put since 99% of printers won't like the Atari EOL ($9B) character "un-
translated." If the translation is in the Atari OS, and you have an XL/XE
series machine, you have an option I did NOT on my old 800: copy the OS
into RAM and patch the translation code out of it THERE. Again, you become
incompatible with Text mode.

> Should I just write my own handler?

For best results, yes, you should write your own handler that can be
toggled between TEXT (perform EOL -> CRLF translation) and GRAPHICS (don't
perform translation) modes at run time. It would have been nice if Atari

had thought of this in the first place, but graphics printers essentially did not exist at the time this stuff was developed, so... nobody thought of it.

All bets are off, though, if you succeed in sending raw data out of the SIO bus but the translation still occurs: that would mean the translation was taking place onboard the P:R: connection itself and you're in the same boat I am: no reprogramming unless you want to burn your own PROMs.

> Please, take the time to educate this poor fool.

I hope I have.

Oh, almost forgot to discuss the workaround. :-)

Instead of printing EIGHT bits of dot-graphics at a single pass, print SIX. The value $9B will never arise and you will never run afoul of the translation mechanism. You WILL have to change the line spacing on your printer to 3/4 of what you've been using.

Doesn't the names Ken and Ryu S. Long mean anything to you?
As in Sheng Long?
As in Ken and Ryu?

The only thing suprising me is that this issue isn't April's magazine.

Well, the PR conection loads an handler out of itself for the
serial ports; they even include the source of that in the docs, and
it of course performs ascii to atascii translation. No mention of
a driver, or translation, or anything is made regarding the paralell
device. HELP!
Does anyone know where the translation occurs?

>About your failure to use the SIO vector: did the I/O attempt simply FAIL,
>or did it succeed but continue to experience translation?
>

It failed. This is what I did.
load DDEVIC ($300) with $40 (p1)
load DUNIT ($301) with $01
I tried both $57 and $50 (write with and without verify for the disk)
my mapping the atari suggests that one will work with the
printer...in DCOMND ($302)
I set bit 7 (send data) in DSTATS ($303)
then loaded the buffer adress and length into DBUFLO/HI and
DBYTLO/HI ($305,$308) respectively
then I called siov ($e459)

Nothing...Should I have set a time out value, aux values, why
doesnt this work?

> I downloaded somefiles from the Atari site and some of the files have a
> ..dcm extention. What does this mean and how do I use these files?

The dcm extention means that the file contains a disk image created with Bob Puff's Diskcomm prog. This prog examines an entire disk, boot sector, vtoc, etc, and crunches it into a file suitable for up/downloading/archiving. In order to extract the disk you need Diskcomm, which is at the archive under the filename Dskcom32.*** (i'm not sure whether or not it is arc'ed or not).
Hope this helps.
Mephistopheles

I'd like to know this as well... mainly what I would like to know is:
What are the equivilent SERIAL or PARALLEL pins for the SIO.
I am trying to build a cable so I can use newer hardware, and I need to be able to use standard serial ports. I know it is possible because the ST X-Former (8bit emulator) can control the 8-Bits 1050 drives, and the ST has a serial port. (they use a connector going from the st port, into a dummy SIO end). I just wish I knew what pins went to what so I could do the same for ALL devices.

As for GIF viewing.. (btw: GIFs are COMPRESSED! Not exactly easy to simply load up and smack onto the screen)
There are two great programs out there that you should look at:
1) is AT8GIF - it loads up GIFs into either 320 x 192 x 2 (b/w mode) or 160 x 192 x 4 ... it TRIES it's damnedest to make the thing come out right using red green & blue dots, but I've yet to see a REALLY nice picture made with it, other than 320 monos.

2) is APACView - it loads up GIFs into APACmode- this is an 80 x 96 x 256 (color) mode. Higher versions can also handle removing ONLY the b/w data (giving you an 80 x 192 x 16 grey-shade screen) and ONLY the color data (giving you an 80 x 192 x 16 color screen). From there, you can put the two images together and reload them into either Pryzm or Interlaced APAC mode (I prefer the latter) which are 80 x 192 x 256 (color) modes. Yet ANOTHER way you can load files are into red-only, green-only and blue-only screens in either 80 x 192 x 16 red or green or blue shades AND 160 x 192 x 4 r/g or b shades. From THERE, you load them up in anothe program made by this author (Jeff Potter) called Colrview which displays the 80 x 192 screens in >>4096<< colors!!! AND 160 x 192 screens in >>64<< colors!!

The way GIFs are compressed is alot like the way ARChived files are made. I'm not sure the difference, etc, but usually when you try to get an ARChiver program to .ARC a .GIF file, it just ends up storing it because since they compress in the same way, they cant really find a way to squash it anymore (NO, you can't ARC an ARC and then ARC it again, etc. How would you be able to get a 25k file from 1 byte!? :))

Anyways.. if you want to MAKE GIFs, Jeff Potter did it again by making GIFNCode. It can (for now, unless we bug him ;)) only encode 80 x 192 x 16 grey shade screens, 160 x 192 x 4 colors (any old colors) screens and 320 x 192 x 2 (mono.. I suppose the colors can still be set) screens.

Good luck. I suggest nosing around the graphics newsfeeds and bugging them since most of use 8-bitters use good old un-compressed or Koala-style compressed files :)

Wasn't there something (I think it was for 800's only...ok..is there anything for non-800's then) that let you have multiple OS's hooked up and you could switch between them? It wouldn't be too difficult, would it? (pretty dangerous, I'll guess, with the power ON tho!)

All this talk of Demon Attack makes me miss all the OTHER I-magic games. (I had them/saw them) for the 2600. They were, by far, the best games for the 2600. If not in the game play, at least in the looks. My vote for 2nd places goes to Activision, but that's another story :). Anyways. Of all the games I saw from I-magic, I thought Demon Attack was the worst! :) What other cool games did they release on the 8-bit machines? Did they ever make that "put out the fire" one? (forget it's name..never had it) or Atlantis (I think I saw that on some "for sale" list for the 8-bits) or that REALLY cool game where you ran into castles and stole stuff from really mad looking dragons. (inspired me to make one of my old games (the 1st where I actually figured out how to make a user-defined chset!) called Crown Quest)

Ahh the memories... :)

Ugh.. yet another "hide me under the OS, I'll be fine!" routines to run.
I crashed Hyper E: by loading up a DLI (probably a bad DLI though, but
still). Also, do you think that you'd have enough memory!? Say with
Hyper E:, TDLine, the new FP routines, etc.etc. running.... :)
I seem to like the thought of popping chips in i guess...heh

In a previous article, jim@neb (Jim Hood) says:

>Someone posted a message a few weeks ago or so talking about an
>atari 8-bit archie mailer site. I mailed there, but recieved no
>reply (probably just the return path got trashed.) Anyway.....
>
>I have limited FTP ability. Are there any FTP sites that carry
>atari 8-bit files?????????
>
>I prefer a posted reply (as mail sometimes bounces around), but if you
>prefer to mail, then use the addresses in the signature.

From the comp.sys.atari.8bit/Info-Atari8 Digest FAQ List:

What is the atari.archive?
atari.archive.umich.edu is the Internet site which contains many files for the 8-bit Atari computers. The 8-bit Atari Archive Moderator is John Dunning, jrd@stony-brook.scrc.symbolics.com.

How do I download files from the archive?
Two methods:
1. If you have FTP access you can FTP to atari.archive.umich.edu (141.211.164.8), login as "anonymous" and type in your e-mail address as your password. Now type "cd atari/8bit" to reach the 8-bit directories. If this is your first visit to the archive, be sure to download the file -read-.-me-. Other files of interest are 8-bit.cat, containing 1-line descriptions of all the files available, and 8-bit.text, which contains paragaph-long descriptions. Be sure to have file-type set to BINARY when downloading binary files (.arc, .com, etc.)
2. Send mail to BART, the atari.archive file-server. BART's address is atari@atari.archive.umich.edu. If you are a first-time BART user, send it a message that says:

help
send 8bit/-read-.-me-
send 8bit/Index

BART automatically UUEncodes binary files before sending them to you.
Other files of interest are 8-bit.cat, containing 1-line descriptions of all the files available, and 8-bit.text, which contains paragaph-long descriptions.

How do I upload files to the archive?
Three methods:
1. FTP to atari.archive.umich.edu (141.211.164.8), login as "anonymous", type in your e-mail address as your password, and then type "cd atari/8bit/new". You may upload files to this directory. Be sure to set

file-type to BINARY if uploading a binary file (.arc, .com, etc.) Also, please upload a short .text file describing your upload so John Dunning can tell what permanent directory to move it to.
2. Send your upload by e-mail to jrd@stony-brook.scrc.symbolics.com. If you're sending a binary file you must UUEncode the file first. Be sure to include a short descrption of the file at the top of the message so he knows what directory to place it in at the archive.
3. If you can neither FTP to the archive nor e-mail to John Dunning, then you are welcome to post your file, UUEncoded if binary, directly to comp.sys.atari.8bit. You'll then be relying on someone else to take your posting and upload it to the archive for you.

No need to write anything, there is at least one GIF viewer in the public
domain for the Atari 8bits. The problem you will run into is resolution.
Most of the pictures out there are in resolutions high enough that they
look rather poor when displayed on a 40column screen.

Newell sold a replacement OS for the Atari 800 that had faster floating point routines than those written by Atari. Atari published the 400/800 OS source code, but they never published the source for later versions of the OS.

Demon Attack requires the old 400/800 OS to work. To run the translator, you have to boot from disk - which won't happen if the cart is installed. And once the machine is booted, you can't plug in a cart and have it recognized.
Demon Attack didn't use Atari's published OS routine vectors, but instead used the OS routines in the 400/800 directly. As a result, when Atari rewrote the OS for the newer machines, those routines were moved (but the vectors pointed to their new locations), and software like Demon Attack won't run on newer machines.

By the way, I strongly urge you to NOT remove/insert a cart with your machine powered up. Yes the XL/XEs have better protection, but the micro power surges won't do your machine any good either.

I don't know if it will work, but I wonder if you couldn't get a 400/800 only cart to run by using SpartaDOS X and the translator. SDX is a cart based DOS that allows you to plug in a cart on top of it, and can turn that cart on and off. Has anyone tried it?

Well, I went out yesterday and bought TazMania. The game looks great
but it's really boring. I mean if you can't get me interested in the first
level, i'm not gonna sit there and dredge through it just to see if it
gets any better. I'll try it one more time today, but I'm glad I can take
it back for a full refund. I don't understand why so many people were
saying that the game is awesome and hilarious, it's not.
just my humble ol' opinion...

Hello, I got an Atari 800 in 1981, thereabouts, and have a ton of games, etc left over from that era. Circa 1986 I moved on to an Apple //gs. Right now, I'm still on my Apple, but want to resurrect my 8-bit Atari. I have 48k, 2 1050 Disk Drives, and an archaic 830 modem. Where can I get a 2400-baud Atari modem, and a copy of the latest/best DOS?
Thanks in advance.

>hardware and all. (Actually I'm not totally convinced of that, but I'd
>love to try it and see.) Surely you could at least get "combat" working. :)

Actually, the 2600 was not too slow. The processor was a 6507 running
at 1.19MHz (faster than the Apple][and the C64). A lowly 8 MHz 68000
actually only runs slightly faster than 2600 processor (if your
instructions are limited to byte accesses to memory), and forget emulation.

>>Sometimes I think the world has gone emulator crazy.
>
>And with good reason; an Atari ST or Amiga could probably run 2600
>games better than a 2600. As for shareware fees, how many people do
>you think would really register something like that? I'd estimate
>zero, offhand -- this is a definite freeware product.

I seriously doubt that you could run 2600 games at full frame rate.
The hardware/software interactions were very timing specific, so what
you really need is a state level simulation of the 2600 hardware. You
would find it difficult or impossible to get it to run real-time on a
50 MHz '486.

>One more time: Does *anyone* have any pointers to detailed 2600
>programming info? (Please? Pretty please? Grovel, grovel.) :)

I once reverse engineered the 2600, but no longer have the documents
(it was for another company that I worked for at the time). There is
not very much to the machine, but it is not a simple architecture
like the ST either. A C64 emulator would be much easier to implement.

In a previous article, Jim_Johnson@abcd.Houghton.MI.US (Jim Johnson) says:

>Demon Attack requires the old 400/800 OS to work. To run the translator,
>you have to boot from disk - which won't happen if the cart is installed.

I have Demon Attack on disk, but it still requires the Translator, but it
does work if you boot it up.
On another note, this is considered Public Domain, as according to the
police and federal agencies, since the copyright/rights only last about 7
years, and so any software 1984 and previous is in this area. The reason I
know this is a 'friend' who wasn't always on the legal side of the law got
nabbed by the authorities, and managed to get his equipment and most of the
software back due to a small problem in their search warrent. They kept the
pirated games dateing in the last 7 years, but anything older than 7 years
was returned.

Heeeeelp! I downloaded High Tech Team's "Big Atari 8-bit Demo" and it doesn't work! All I can get it to do is boot side one, which says "High Tech Team Presents..." and then "The BIG Atari 8-bit Demo" and then it loads a little bit and just sits there. I tried FixXL (I'm using a 1200xl, it's had trouble with Das_Omen as well as K.O.Distributers' Fred and Mission Shark games/PD-demo games) but all FixXL does is get me one screen beyond this where it says "Programmed by..." etc.
Of course, when I boot side 2, it says "...SIDE B Flip the disk...." and just sits there.

What's the deal!? Should I just go out and get an 800xl!? ;)
(even tho it doesn't have this awesome keyboard!?)

Oh... good question just popped up. How hard is it to replace keyboards between the 800xl & 1200xl. Opps.. No deal. I just remembered the F-keys and Console buttons & the like are on the side on the 800xl.

Damn!

$.02 I had a chance to buy 2 or 3 at an Atari warehouse sale @ $100 each. I'd just quit work to go back to school so I didn't want to spend the money. Whwn I talked to Bob Wooley about it he said get 2 & he'd pay for both & let me keep one, but it was to late. I continued to try to hunt one down & talked to Bruce at B&C Computer Visions. He said he had a line on one so I passed the info to Bob. Not sure if that's where Bob W found out Bob Brodie had one, but sure enough, Bob W. got one from Brodie & got it up and running for a SLCC meeting. About 4/8-bitters & 40 ST users. Bob had the 1450 loading GR. 9 pics from Computer Eyes. I'd like to think the ST users were mildly impressed with the display rate. I talked with one of the original engineers at Atari that worked on the project & even he said something to the effect of "too little, too late." Great machine: dual 360 k floppies on the bus, I/O performance that seems like a ramdisk, 1200XL style keyboard. If I had it to do over again! I heard there were only a couple of dozen made that were shipped to developers such as the one who developed a talking modem program. Somebody like Tandem was supposed to have made a production run of the PC boards for either the 1400xl or 1450xl, but Uncle Jack decided to stiff 'em for the monies owed since he didn't want to introduce the thing so rumor has it they're in a land fill somewhere.

I don't know much about the 800s but it is relatively easy to simply stack several OS ROMs and run wires from the chip select lines to a switch (making sure the proper pull up resistors are used, etc.). Just flip a switch and you into a new OS. No need to power off. The most you can do is crash the system since you are just toggling a select line.

Another approach is the Russ Babylon OS switch. (I have one installed in my 800XL). It is simply a switch that harware enables the RAM under the OS as the OS. I.e...Load another operating system into the RAM under XL OS, flip the switch and that RAM now functions as the new OS (usually without even crashing). It's a fun and very simple little upgrade.

[stuff deleted]

Actually, A big part of this game for me was getting used to the controls.
I didn't care for the first level, either, but once I got used to Taz's
movements the game completely changed. It took a few hours, but once I
did that, it seemed quite reasonable. The following levels are pretty
decent, too. Haven't gotten past the mine, though. I'm messed up by the
jump that ends with a barrier. I suppose I have raise the cart in
mid-air or something.

Keep trying, it grows on ya,

>Aside from the incredibly cramped memory space, the gap at page 1 means that
>you cannot use the JSR instruction, since there is no memory where the stack
>would normally live.

The processor is a 6507, which is internally the same as the 6502, but built in a smaller package with only 13 address lines and no IRQ line.

The RAM is on a RIOT (RAM, IO, and Timers) chip. I don't remember the exact chip number but it may have been a 6526.

Zero page and the $0100 page are mapped to the same memory locations. You have hardware registers in the lower 128 bytes of of the pages, and memory in the upper 128 bytes (actually there are less than 64 hardware registers and they are mapped twice within each page).

You can use the JSR instruction, and you do have a stack, but you have to be very frugal with your stack usage since it is a significant portion of your total memory.

In more recent years (since 1983, when I wrote my last 2600 program) Atari has probably integrated all three of the chips in the 2600 into one chip, but it would have to be functionally identical to the earlier system.

Holy wrong newsfeed, batman!! I don't get rec.games.video, but I do get
comp.sys.atari.8bit.. I think you should just post questions like that
(unless I'm TOTALLY out of it and they've made Contra III for the
8-bits!) on rec.games.video ONLY..

thanx... just a tip... so us less-informed
8-bitters dont go around asking about games that dont exsist.. (sigh)
:)
later
(BTW: still love that .sig. ("dammit jim, I'm a free man, not a number")

Yep, I could never figure out a good way to actually send 155 to the printer. Somehow it's always converted to some other value(s), but I forget what they are. My solution was to not allow 155's when creating fonts--the font editor notifies the user if a bit arrangment for a character includes a 155; if the font was just converted by a utility program, I made sure the utility program converted 155's to 151's. Not perfect, but the difference was tough to notice.

If I remember correctly, I also had to disallow 13's because some printers (like the Gemini 10X) would do crazy things when I tried sending a 13 to it.

Another solution, which may work for some people but was impractical in the Daisy-Dot programs, is to act as if your printer had only 6 pins for graphics--this way, the bit-1 pin is never activated and neither 13's nor 155's will ever show up. The down side is that you end up needing more passes of the print head to print the same amount of data.

P.S. Are a lot of people still using Daisy-Dot III? Does everyone know about the extensions that have been added? It now supports integration of PrintShop icons and MicroIllustrator Files into your output. If not too many people are familiar with it I'll be glad to post some more detailed information about Daisy-Dot III's capabilities.

Activision also released Demon Attack on diskette, along with Pitfall.
This was years after the cartridge release. The disk-based version runs
properly on an XE.

I think they send over the data serially to the gameconsole. The chip it's
just a shift-register (probably anyway). The signals that goes from the
controller should be something like:

Vcc (+5V or something similair)
GND
Clock for shift register
Load data into shift register
Clear shift register
Serial Data

This is just what _I_ think it is. I was working on a similair projact a time
ago, and the above is what I think is going on in a NES controller...

Actually... APACmode is 80 columns and it works rather well. Instead of
just skipping pixels, it averages them together, so the end result would
probably look the same if you had 2 monitors next to each other, one with
the IBM (VGA, for example) version and the other with the Atari (APAC)
version and stepped back a ways..

2861. AMODEM/interfacing BASIC w/ modem

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-19 03:55:36 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <DR55NB2w164w@cyberden.uucp>
Source record: 110308

I've FINALLY found out how to determine if there's information in the modem's buffer, at least when using most of the SX212 R:handlers I have. The way to do it, just in case anyone else has been having problems with messing with the modem, is to do a STATUS call and THEN check the buffers. It's sort of a weird way to do it, but it works and I guess it was made to be done like that.(?) Anyways.. at least with this program (it's HANDLER-SX.. I forget who by) as well as I guess with a few other SX-hanlders (and one doc. I have says that it's 850-compatible so I'll suppose the lot of the SX ones are too..?) you do a STATUS (ignoring the returned value) and then check address 747 (decimal) to see the size of the buffer. I've learned (the hard way) that BASIC just can't do it well at 1200 baud. I've sorta tricked it by assuming that everything with more than 80 characters contains a [RET] or CR/LF in it, so it do a "get-record" (aka INPUT in BASIC) until the buffer is <80 characters. From there it does it the SLOW way by reading the buffer byte by byte.

Anyways... what's the point!? There isn't really one except I am really curious if TurboBASIC XL is able to load any of these hanlders. I've tried a few and when accessed they all love to crash the system. So what can I do!? Is there any little routine that will act like a "get-record" even if there ISN'T a [RET] or CR/LF at the end of the info? (which would cause the hanlder to freeze until there was one in the buffer if you did a get-record w/o being SURE there was) I'm utterly bored and want to try to make a little Michtron-like BBS, minus the multi-line capabilities and all that. (I'd also like to include some pretty decent games on the lines of SEE (SRE on IBM BBS's) and TradeWarz and the like...)

Thanx much for any info.. cant wait to find out how the hell to do this! :)

OK, needless to say I retract my statement that a 2600 emulator would have a reasonable probability of succes :-). Thanks to everyone who responded by posting the specs for the 2600, and especially to James Hague who mailed them to me and told me not to waste my time.

I thought the 2600 had DMA video hardware like the Atari 8-bit. I also didn't know the 2600 ran at 1 Mhz. "Oh, that's very different. Neverind."

I can think of Omnimon, Omniview in a few variations, CSS has an OS that allows for booting in high speed for disk drives. I think there was a an outfit in Sacramento CA that had one two. When I picked up some used disks at San Jose Computer I found Ultra OS or something like that. It was probably a pirate copy of a ROM, but who knows. Changing the OS isn't that hard. It's a little tougher on an XL since the source code was developed on mainframes & the rumor has it that they were one of the 1st things sold by the Tramiels when they took over, W/O saving the files!#$@! What I do is just assemble a short segment of the original OS then search for the same sequence of bytes in the XL OS. I haven't done anything really fancy, just a few things like changing margins & colors. Would be neat to do more, but I'm hooked on Omnimon. Still, Omnimon could be better: It still reads paddles 4-7 which is a waste of time on an XL (Unless you pull the POKEY & put the hardware back in!) I know I'd like a simpler way of hooking into the VBI. The way Atari should'a done it is have a RTS set up in low ram followed by 3 reserved bytes. That way you could just change the 3 bytes to a JMP (anywhere?) then change the RTS to a NOP. I know Bill Boderstein (sp?) did a lot of mods in Analog. Tough call on what the best OS would be. Fast floating point routines for sure, built in monitor is nice.

The status command is pretty much the way to do it. The only combination of Turbo/modem handler I've got to work is with SDX using banked memory on a 256k machine. This give a low mem that's small enough so you can load the handler & still not bump into TB. Short of a DOS rewrite to give you a lower lomem (this assumes the SX handler is relocatable), you're up a creek. You still don't have Action! do you <g>. Send me your address via E-mail & I'll let you use my funky spare with the requirement that if you ever move on to another computer you RETURN IT! It's not for sale. I'm fairly adept at programming in Action! so I can help out a little. It'll take you a month to change from TB to Action!, but if someone told you: I have a language that's 1/10th as fast, produces spagetti code, is incompatable with most DOS/modem combo's, is only marginally compatable with older 8-bits, needs to have a runtime package distributed with all your compiled programs, would you buy it? Right, it's free so thats why you use it. I can't think of any commercial programs that were developed in TB, but there were quite a few in Action! Believe me, using the Action! runtime & having your code compile to anywhere in memory is easy. You can even write modules that load from disk then execute. The only other real alternative you have is Basic XL (like Bill was saying) which well set you back $20 to $50. Even then you can't distribute your programs to people without Basic XL. When you start taking CS courses you will be much better prepared for PASCAL & 'C. I do have a copy of MMG Basic compiler which loads at $2400 so that would probably work, but I wouldn't reccomend it.

> cart on and off. Has anyone tried it?
>
> -- Via DLG Pro v0.992
>
> Jim Johnson-
> *** Remember, they're only tools - Not a way of life! ***

I have tried it without much luck. If the Cart does not allow DOS to boot
it will not let SDX grab hold of the system either. And I am not about to
go plugging carts in on top of my SDX Cart with the power on! (An 800xl
can be replaced.... Try finding Sparta DOS X these days!)

My favorite translator, though, is one called Ultra Translator. It allows 52k
or 48k OS modes, Basic on/off toggle and some other things. I rarely use the
translator since most games that require it arn't worh the effort (IMHO).

I have for sale,

Kid's Computer Keyboard - Muppet Learning Keys: This is a colorful Muppet keyboard, plugs to the joystick port, made by Koala Technologies. Includes software. Works with Atari 400/800/XL/XE computers, and with c=64. LIKE NEW, original box.

Also have- Atari Trackball, various joysticks, some very high quality.
PRICES:

I am looking for best offer within a couple of days.
The following prices will get the pertinent items without
delay and without further waiting if anybody will be willing to pay them (otherwise I'll take best offer)-
Muppet Keyboard with software and box (like new): $25
And a few dollars each for the joysticks.
If nobody offers these prices, I will accept best offer. within the next few days.
Please e-mail to COHEN@BORN.PHYS.VIRGINIA.EDU
or call (804) 293-8973.
I will acknowledge all and every message that I receive via e-mail.
Thanks.

featuring an EXPANDED

8-BIT COMPUTERS SUPPORT AREA !!

You may have heard about the Cleveland Free-Net Atari SIG, or you may even have a Free-Net account that you don't use much. Now is the time to visit the Atari SIG and see what you're missing! The SIG has been reorganized, bringing even more information to you and making it even easier to access and share. The Atari SIG continues to support ALL Atari systems: 8-bit, ST/TT, Portfolio, and Lynx. The Cleveland Free-Net Atari SIG's 8-Bit Computers Support Area is GROWING!! Where better to get together with fellow 8-bit Atari users? Where is there a more extensive collection of information invaluable to any 8-bit user? The Cleveland Free-Net Atari SIG is THE 8-bit Atari information resource! The new Atari SIG debuts on July 20, 1992. Information on how to join in this expanding 8-bit user community is included later in this document.

First, here is an overview of the Cleveland Free-Net Atari SIG's Main Menu

<<< THE ATARI SIG >>>
(go atari)

1 About the Atari SIG
- A text-file containing general information about the Atari SIG

2 SIG Menu Outline
- A map to help guide you through the extensive Atari SIG menus

3 Atari News...
- An area devoted to bringing you the latest news in the Atari world

4 General Bulletin Board
- A place for discussion among all SIG members

5 8-Bit Computers Support Area...
- See below! Once you explore here, you may never want to leave!

6 16/32-Bit Computers Support Area...
- The area for ST/TT users

7 Portfolio Support Area...
- The area for Portfolio users

8 Lynx Support Area...
- The area for Lynx players

9 Wanted & For Sale Board
- A place to buy and sell Atari equipment of all kinds

10 Voting Booth...
- A place for SIG members to make their voices heard

11 Atari Library...
- A vast store of general Atari information

12 Help-Line (Q & A)
- A place to challenge the SIGOps with technical questions

13 SIG Directory Services...
- The names of all SIG members can be found here

Now, let's take a look at the new, expanded 8-BIT COMPUTERS SUPPORT AREA:

The 8-Bit Computers Support Area has something for everyone, from the new owner to the experienced and advanced user and programmer of the 8-bit Atari computers. Here is a small overview of each section and its contents:

1. About this Support Area
- What you are reading now.

2. The 8-Bit Atari Computer
- A fairly detailed historical description of the 8-bit Atari computer, along with a brief overview of what makes the system so popular.

3. FAQ List
- The Frequently-Asked Questions (FAQ) list which is posted periodically to Usenet's 8-bit Atari newsgroup, comp.sys.atari.8bit.

4. 8-Bit News
- The place to find the latest announcements in the 8-bit Atari world.

5. Bulletin Board
- A general discussion board just for you and your fellow 8-bit Atari users!

6. Programming Forum...
Led by the Atari SIG's programmer-in-residence, Peter Haller

The 8-bit is still a popular choice among programmers. The 8-bit Atari computers allow for a level of control over the hardware that is both straight-forward and powerful. Even though these machines have gone out of production, the

dedicated user base support these machines. This forum
is for those programmers - both novice and the die-hard hackers
- to share secrets, ideas, problems, and remember the 'good
ol'e days'.

The 8-Bit Programming Forum is broken down into the following
areas:

1. About this Forum - You're reading it!

2. 8-Bit Programming FAQ (Frequently Asked Questions) List -
the name says it all! This will hopefully release the
open forums from the simple and common questions that
newcommers have. This list will be updated at the
beginning of every month.

3. Resource Center - This is where you will find code samples,
helpful hints, and the best PD development tools info,
among other things. Post your neat little hacks in
here for all to enjoy. If a group project ever gets
started, then this is where all the code will be
placed. This is a moderated area, so we can keep it
clean. This newsgroup may eventually expand into a
submenu depending on the amount of information it
contains.

4. 8-Bit Hacking Board - This is the catch all area. Any
programming related questions - from BASIC to Assembly
- will be fair game here. This area is unmoderated, so
watch the language.

5. The Asylum - Grab a Jolt and call up Dominos! This is the
General Programmers Forum of the Atari SIG. All
programmers are welcome. Take a browse, flame at your
machine, or just listen in on Atari related programming
subject. This is totally and completely unmoderated,
so if you can't take it...

7. Product Summaries
- A place for 8-bit users to share shorter product summaries which
make obtaining a new product that much less of a hassle

8. Product Reviews
- One of the biggest assets of the 8-bit area. This board holds
reviews of many of the most popular products available for the
8-bit Atari (and some of the duds too). Check here before making
your purchase, or write reviews for the SIG for the benefit of
others.

9. Tips & Tricks
- A place for you to share those neat little things you've
discovered while using your computer that make the system
even more enjoyable.

10. File Area...
The 8-Bit File Area is here to make it as easy as possible for you
to upload and download public domain and shareware files to and from
the Internet's Atari Archive, located at the University of Michigan.
Here is a small overview of each section and its contents:

1. About this File Area
- What you are reading now.

2. How to Send & Receive Files
- Instructions for how to transfer files between
your 8-bit Atari and your Free-Net account.

3. BART Instructions
- These are the instructions for using BART - the
file-server used to retrieve files from the Archive to
your Free-Net account. Also included is the address to
which you can send files to contribute to the Archive.

4. File Listing
- The listing of 8-bit Atari files available from the
Archive.

5. Atari File Request Board
- A place for you to ask your fellow SIG members for help
in locating desired PD or shareware files that are not
available on the Archive.

6. Atari File Help Board
- A place for you to discuss any problems you may have in
transferring files between the Atari Archive, your Free-
Net account, and your Atari computer.

11. Info-Atari8 Digest
- The Internet's comp.sys.atari.8bit echo - this is the place
to read it!

12. Z*Magazine
- Your source for the one and only International Atari 8-Bit
Online Magazine. This immense resource will eventually hold the
ENTIRE, 210+ issue library of Z*Magazine, the grandfather of all
Atari online magazines, going back to May 1986. Where else can
you find a resource like this?

13. 8-Bit Computer User Directory
- Be sure to add your name to this directory and be counted as one
of the many 8-bit Atari users of the SIG.

The Atari SIG also periodically takes advantage of the Free-Net's conferencing
ability to hold real-time, online Atari conferences. Recent conferences
included a chat with the Moderatator of the University of Michigan Atari
Archive, Jeff Weiner.

In addition, the Cleveland Free-Net provides Internet mail access, plus full
access to Usenet, including the newsgroup comp.sys.atari.8bit.

About the Cleveland Free-Net, and How to join:

The Cleveland Free-Net is the primary system in the ever-expanding
NPTN, the National Public Telecomputing Network. Get in on the action in this
futuristic network! Here's how to access the Cleveland Free-Net:
With modem,
dial (216) 368-3888
300/1200/2400 bps

Or from the Internet,
telnet freenet-in-b.cwru.edu
(129.22.8.75)

When connected, you may either browse the system, or you may apply for your
Cleveland Free-Net account. Application is easy, and of course it's free!
Finally, type "go atari"!!!

For more information on the Cleveland Free-Net Atari SIG, write to:

The Atari SIG
P.O. Box 364
Mentor, OH 44061
U.S.A.

or Internet e-mail to

xx004@cleveland.freenet.edu

See you on the Free-Net!

Michael Current, aa700 / currentm@carleton.edu

> important, it seems like a bit of work.
>

The Nintendo controller uses a shift register IC to multiplex 8 lines to one input. There are 5 wires. Power, ground, clock, reset, and data. you *COULD* connect an Atari type joystick by simply hooking up the switches to their Nintendo counterparts. The Nintendo controller is not as complicated as it seems. I remember hooking it up to a TRS-80 once.

I would like to comment on a message left that once they installed SpartaDOS X his (or was it her?) 800XL became a PC.
I sold all my Atari stuff about a year ago - the only reason was I needed a MSDOS machine and the only way to afford it was to sellout all my Atari stuff.
However, I had an 800 with USD1050 for my kids so they would leave my system alone; which was a 320XE with 1meg MIO, XF551, 20meg hard drive (and a bunch of other hardware add-ons), and used SDX with the R-Time8 cart.
It wasn't unusual for me to move ASCII files between my PS/2 at work and my Atari using a disk translator utility on the PS/2. I was rather productive at home using TextPro Plus. With the similarity between SDX and MSDOS, I was equally comfortable at either machine. If it is still floating around out there (I know it was available from ICD's BBS) I wrote a small SDX utility called ECHO to mimic MSDOS's ECHO command (especially useful with file redirection) which made SDX's batch processor even more familiar.

I've got a copy or two. Played it on both the ST & 8-bit. Not much difference between the two. It's a pretty good adventure game as far as the genre goes. I don't do many text/adventure games, but I think you'll find it about as good as some Infocom games. I think you can buy it new for $5 now. The parser is good & the pictures are well done, but tend to get in the way after you've seen them once.
BTW: I've had some E-Mail bounce back to me. some people wanted to know where to get 8-bit soft/hardware. I'll reply in this conference.

Sure, it's called PC Xformer. It's my MS-DOS port of the original ST Xformer.
Drop by the MIST Atarifest next weekend and I'll show it to you. It's not
available for purchase, so you can only look at it. The reasons for that
have already been discussed here ad nausium, so don't ask why.

> --

I doubt there are any copies 'not legal' copies of Alternate Reality
around.
I've bought the game too. I don't like using my original disks for
playing. I prefer making backup copies, that way I can be sure
my originals won't get damaged. I've tried making a backup
copy of AR-The City without success. It uses a very sophisticated
copy protection on the first side of disk 1.
One track has multiple bad sectors and some sectors with similar
sector IDs. Even attempts with my upgraded 1050 failed.
I was only able to make a 'demo' copy. This means the game works,
but your character is ill and dies very fast.

<Throwing caution to the wind>

Why? I must have missed those ad nauseum discussions which took place here. Anyone out there care to give the newcomers a break and post or email a brief summary explaining why Darek refuses to release his PC version of the 8bit emulator? I'm sure Jeff, myself, and many others would me most appreciative.

Thanks!

2883. Dead 1050

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-20 22:15:16 UTC
From: poehland%phvax.dnet@smithkline.com
Message-ID: <9207202215.AA16377@smithkline.com>
Source record: 110330

In response to Preston Crow's lament about a dead 1050. After repairing several dozen 1050's I thought I'd seen everything, but Preston's problem is a new one (for me at least).
I think it is highly unusual for the metal tension band that connects the stepper motor to the to the head carriage to come loose, though with the ageing of the 1050 in general I guess anything is possible. Preston's problem could be relatively simple to fix, or disastrous. It depends.
If the tension band has merely popped off (if memory serves me correctly it attaches to the rear of the carriage by means of a srring-tension thingy), then it should be a straightforward matter to put it back on without disturbing the alignment of the head. That's assuming no parts have loose & fallen out of the case, etc. If you've never seen what one looks like, you'll have to examine a working 1050 to see how the tension band attaches.
If the tension band is broken, or if parts are missing, it is not a job for the casual user. I rather doubt it would be possible to install a new band without realigning the drive head. I only recently succeeded in learning the art of head alignment myself, & it is not an enjoyable experience even for someone with all the proper alignment software & electronic test gear.
Preston is lucky to have a Tandon mech. Anyone these days who owns a 1050 over 5 years old (most are older than that) is well advised to purchase & keep on hand a spare mech. It's a drop-in replacement you can buy from American TechnaVision for about $45. I own 4 or 5 Tandon 1050's & keep two spare mechs on hand. Really saves you at 3:00AM on Sunday when your 1050 decides to poop out on you....
[Any responses, please post to csa8 or IA8, NOT to me! I'm too busy these days with matters related to Atari Classics & have almost no time for answering non-magazine-related mail.]

Yes, I offered my system at $250 (seemed reasonable to me, but I paid over $1000 for it-- obsolescence sucks :)) but with an "or best offer" provision. Once again, I have an 800XL, two stock 1050's, a Citizen 120D printer, Sony color TV, lots of books and software, and all the required cables/interfaces. Please make me an offer; tell me what you think the system is worth.

[I tried to mail you, but jim@neb isn't a very descriptive address, and I couldn't make the uunet address happen]

Of course, anyone else who wants the system is welcome to mail me.

Jake

Would you be willing to sell a (original) copy? I would give $5 for a used
one if you take care of the mailing. If not, where can I get an oringinal?
Let me know......

Thanks a lot.....

Newell Industries used to / does sell a little board that would switch between OS ROMs on an XL/XE. It's called a Ramrod. I bought one along with an OmniView chip and destroyed my first 130XE trying to solder it in myself (I was ignorant of the damage that even a 25W soldering iron can do to a multi [dual] layer PC board). It would have cost about 3/4 of the cost of a new 130XE to repair it, said the repair shop, and we can put a socket in a new 130XE for the cost of the socket (plus the up-front fee that this place charges at the storefront). So I bought a new 130XE (this was around 1985/86) and had the shop put the socket in. I wrote off the Ramrod (it was soldered into the old XE board) but I sometimes wish I'd bothered to put it in. (I still could, but I'd have to desolder it from the old XE's board first, and cut a hole in the new XE's shielding, a switch hole in the case to avoid "hangy wires", etc.) But there are few programs that I have tried (not that I've tried thousands, but...) that just won't run under the OmniView OS. The @#$%^&* Electronic Arts _______ Construction Set programs won't: "Remove Custom OS" is what the protection kludge told me. So I 'removed' the EA programs - sold/gave-away all two of them I had been given by a former 8-bitter. Letter Wizard won't, but it is a yukky WP anyway, OmniWriter 80 is better. And so on. The only regret is that Ace of Aces (cart.) wouldn't work.

>If memory serves, isn't XIO 254 the "format disk" command? That particular
>XIO has been around forever, and is quite alive and well in DOS 2.

Well..... I was just pulling a number from memory. In any case, the
reason I liked some of the XIO commands, is that you *didn't have
to* go back into DOS to do certain things. Here are a few XIOs for
your information.

XIO 32 rename
XIO 33 erase
XIO 35 protect
XIO 36 unprotect
XIO 41 load a binary file
XIO 253 format disk in any format, any drive
XIO 254 format an 810 disk

>>I am pleased with DOS 3. It does the job.
>As long as you're willing to accept being incompatible with virtually
>everyone else in the Atari world, yes.

Incompatible? Well, different format yes, but hardly incompatible.
Incompatible is trying to use a Commodore disk. When I could, I
just converted DOS 2 files to DOS 3. If not, oh well, I'd use DOS
2. I used to think of DOS 3 as basic copy protection. If I lost a
disk, hardly anyone would be able to copy, or use it. heh heh.

>>I remember the old DOS wars, especially with th primary "reason"
>>against DOS 3; the use of 1024 byte blocks, but then again, no one
>>complains about hard disks and the size of their blocks, do they?

>Hard disks' blocks are generally 512 bytes -- immediately HALVING the

>as a percentage of the available disk real estate, on an Atari floppy than
>on any hard drive. I'd be much more sedate about wasting 1024 bytes of
>storage on even a small (10Meg) hard drive, than on even a double density
>(~180K) Atari floppy!
>

Still, there are hard disks that use larger blocks. And besides,
how many times does one need every single byte out of a cheap disk?
Look at some of your disks and look at some of the free space. But
in any case, I got disks extremely cheap, and used a ton of them-
like using folders on my Mega 4. Scripts on one disk, GIFs on
another, etc. Besides, floppy disks are still cheaper per byte than
any hard disk. Hard disks are though, faster and more convienient.

>>Another little feature about DOS 3, is that when you exit to BASIC,
>>and then want to get back to the DOS menu, boom, you're there. DOS
>>3 did not have to reload.

>For which you paid the price of having less RAM available for programs and
>data while in BASIC. But if that doesn't bother you, I recall SmartDOS could
>be configured for exactly the same behavior. SpartaDOS X does the same
>thing, for that matter, WITHOUT hogging up BASIC programming RAM!
So what if there was less RAM available, there was never any
instance that I got an ERROR-147 or ERROR-2 messages. ANd besides,
one reason I liked DOS 3, it was FREE! For the most part, I
preferred the DOS menu, and I did have some command line control
(with XIO) and I wrote a little three line directory program, so I
didn't have to go to DOS.

For the picky ones, if I REALLY needed RAM, I could configure
system buffers under DOS 3. Can you do that with other DOSes? Lets
have a look.

With BASIC, no DOS, 37,902 bytes
With BASIC, Atari DOS 4, 32,274 bytes
With BASIC, standard DOS 3, 32,274 bytes
With BASIC, DOS 2, 32,274 bytes (no change here)
With BASIC, DOS 2.5, 32,274 bytes (no change here either)
With BASIC, MachDOS 2.1 XL, 30,478 bytes (DOS 2 compatible)
With BASIC, SmartDOS 6.1, RESDUP on, 22,633 bytes
Well, after loading six DOSes (I don't have SpartaDOS) and even
loading DOS 4, I saw no changes in free memory between DOS 3 and
DOS 2. How much free space do you get with SpartaDOS?

>BTW, your .sig misspells SACRAMENTO... ;-) Unless you really do live in
>a place called SCARAMENTO...

I know, I haven't gotten around to changing my .sig. It was the
default .sig, and I haven't felt witty enough to change it.

How about.... Visualize whirled peas. Life's abyss, then you dive.
Read my MIPs, no new VAXes.

NAH!

You know, I have heard that (I think) piece of bull for years. In ALL of the years I've used DOS 3, I have NEVER encountered any bug, lost information, or anything. Hell, I even asked Atari on their BBS and they couldn't tell me of any bugs or even fixes. If there any true, documented bugs, I'd like to know.

I've used various terminal programs, Express, Amodem, etc. with DOS 3 and.... no problems. AtariWriter, AT8GIF, ARC, GIFNCODE, GIFDCODE, nothing. The only time I use DOS 2, is when I am using a protected program that uses DOS 2, or a custom format program, like SynStock.

I recently got the Floppy Controller for my Black Box from CSS. It is supposed to have the commands to use The Archiver Software built in. However, it seems Bob is having legal troubles in being able to release the Archiver software with each Floppy Controller. So, does anyone out there have The Archiver Software that I might be able to pick up relatively cheaply? I'd appreciate it. Thanks

-Lance-

Copy the disk with a hardware copier, or hack the code yourself. That's what I did... I remember the first time I tried cracking it, it seemed to play great, but then some cops would jump out, show you their badge and kill you. (no escaping)... I eventually did get it copied though.

JM> Reference Notes, or the revised edition of Mapping Atari for details
JM> on what the function keys do. In Mapping the Atari, see the XL/XE
JM> Appendix under memory location 96 and 97.

Additional notes from Jim Johnson:
A couple things... First is that the keyboard decoder chips are sometimes reversed on some motherboards - if you find the above connections don't work, simply reverse the connections.

The suggestion for mounting the switches in a diamond shape is an excellent one - it's what I did when I installed my 1200XL function keys on my 320XE several years ago; it is much easier to remember which function key moves the cursor in which direction. Also, I would suggest that you NOT mount the keys directly on the case. I mounted them to a small square pill box and used velcro to attach this box to the lower right corner of the case. A small ribbon cable looped down through the case halves to the keyboard decoder chips. By doing this I could open up the case for repairs without having wires connecting me to the case top.

By the way, Innovative Concepts in Warren Michigan sells a modification kit for the Atari 10key pad and the deluxe version also includes the function keys. The kit guts the 10key pad and attaches it to the keyboard decoder chips the same way as the function keys - the result is a 10key pad that requires NO drivers and works with ALL software. In essence the keys are simply wired in parallel. You wouldn't believe how much easier this is when you have to do extensive numeric entry such as spreadsheets or DATA statements.

From: Jim_Johnson@abcd.Houghton.MI.US
Message-ID: <Jim_Johnson.05rn@abcd.Houghton.MI.US>
Source record: 110341

I've built a couple monitor cables for my Ataries, but I've always built the cables to match my monitor - that is, I used only the luma when I had a monochrome monitor and I used only the composite when I had a color monitor (I never owned a monitor that used both signals such as the Commodore 1702). All the parts are readily available from Radio Shack. I often looped the composite and audio signals through our VCR. By doing this I could use my Atari as a cheap animated video titling machine (of course, without genlock I couldn't overlay images - but it certainly dressed up the home movies). Of course this isn't a direct response to the question about putting signals from the Atari into a SVHS deck, but I thought someone might be interested in the idea.

CXL4025 Atari Defender
CXL4027 Atari Qix

RX8021 Atari Caverns of Mars
RX8026 Atari Dig Dug
RX8029 Atari Real Sports Football
RX8030 Atari E.T. Phone Home
RX8031 Atari Donkey Kong
RX8032 Atari LOGO Computing Language
RX8033 Atari Robotron 2084
RX8034 Atari Pole Position
RX8036* Atari AtariWriter
RX8039 Atari Eastern Front
RX8040 Atari Donkey Kong Jr.
RX8042 Atari Tennis
RX8043 Atari Ms. Pac Man
RX8044 Atari Joust
RX8048 Atari Millipede

RX8049 Atari Jungle Hunt
RX8052 Atari Moon Patrol
RX8063 Atari Rescue on Fractalus
RX8067 Atari Final Legacy
RX8077* Atari Battlezone
RX8077* Atari Ball Blazer
RX8078 Atari Star Raiders II
RX8079 Atari Food Fight
RX8081 Atari Blue Max
RX8082 Atari Lode Runner
RX8083 Atari Midnight Magic
RX8084 Atari Hardball
RX8085 Atari Fight Night
RX8086 Atari Barnyard Blaster
RX8087 Atari Bug Hunt
RX8088 Atari Crossbow
RX8089 Atari Desert Falcon
RX8090 Atari Gato
RX8091 Atari Flight Simulator II
RX8092 Atari Archon
RX8093 Atari One-on-One Basketball
RX8094 Atari Commando
RX8095 Atari Karateka
RX8096 Atari Choplifter
RX8098 Atari Summer Games
RX8099 Atari Ace of Aces
RX8101 Atari Dark Chambers
RX8103 Atari Mario Brothers
RX8102 Atari Crystal Castle
RX8104 Atari Crime Busters
RX8108 Atari Necromancer
RX8109 Atari Airball
RX8111 Atari Tower Toppler
RX8113 Atari Thunder Fox
RX8114 Atari Into the Eagles Nest
RX8118 Atari Xenophobe
RX8120 Atari Super Football
RX8124 Atari MidiMaze

Demos/Limited Prototypes

CB101931 Atari Super Pac-Man
CA400201 Atari XE Demo Cartridge (four games)

???????? Activision Beamrider
???????? Activision Decathalon
???????? Activision Hero
???????? Activision Pitfall
???????? Activision River Raid
???????? Activision Zone Ranger
???????? Big Five Bounty Bob Strikes Back

???????? Big Five Miner 2049er
???????? Epyx Jumpman Jr.
PB101689 ParkerBros Frogger
PB101303 ParkerBros Star Wars: Return of the Jedi

The ones with stars I have not had verified, and may be incorrect. These numbers are unlikely to be wrong, but I can't check them.

The following are games I know were produced, but I have no info on the catalog numbers. They might not be on cartridge for all I know, but if they are I'd like to add them to this list.

Deluxe Invaders
Microsoft BASIC II Computing language
Pengo
Typo Attack

I'd would like help completing this list. If you know of any other cartridges issued by Atari, and/or know the catalog numbers of some of the unknown ones, please send me an email message with details so I can update the list. Thanks.

Message-ID: <92203.102725JJMCWILL@MTUS5.BITNET>
Source record: 110343

Allen Macroware did their BOSS XL, which also reportedly has a very good
machine language monitor in it. I think Synergy concepts did a chip that
offered some neat RAMDISK support and stuff for owners of upgraded machines.
At one time I saw the chip in Brad Koda's BEST catalog. Antic once
mentioned a fairly new one called the Turbo-OS which was supposed to
increase screen I/O and have a monitor that among other things, allowed you
to monitor the IOCB's and stuff, which was really interesting.
Don't know where that one went either. Then of course there is the OS that
comes with the Turbo816.
All in all, I think there are at least 6 commercial OS systems that you
could plug into your Atari XL/XE. I believe there are a half dozen
homebrew modifications to the OS as well, for those with access to an
Eprom Burner, or perhaps with some sort of modification to
make the OS a STATIC RAM chip that is writeable. That would be ideal,
read all your ROMS onto disk, and load in the one you want to use and then
do a coldstart.

Jeff McWilliams

the other way to go with this is to connect to the keyboard
itself, rather than the decoder chips. All you need to do
is find the corresponding lines on the keyboard circuit board,
which is simple if you have a dmm.

I have an old 800 which used to have 48k, but a chip blew (for the second time) on my 32k board, so now it's only got 16K. If anyone has extra memory cards left over from upgrading one to 256k (No, I don't know how to do that, though it may be a good topic to include in the FAQ), I would be willing to payshipping and maybe a little more. (I'm a grad student, so $$$ is tight :-(.)

E-mail me if you're interested.

2903. Alternate Reality - The City (codes)

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-21 19:03:21 UTC
From: UJ1G@DKAUNI2.BITNET
Message-ID: <1992Jul21.190321.19132@rz.uni-karlsruhe.de>
Source record: 110348

Hello,

browsing through old magazines I've found some cheating codes
for Alternate Reality - The City.
To make use of these codes you have to have a kind of freezer.
(A kind of hardware or software that lets you interrupt a game
or a program by pressing a hotkey and then lets you poke around
the memory).

Some memory locations follows:

$8ab6-$8ab9, $8aba-$8abd ---> HP
$8aad ---> Level
$892e,2f,30 ---> Strength
$8937,38,39 ---> Intelligence
$8940,41,42 ---> Wisdom
$8949,4a,4b ---> Skill
$8952,53,54 ---> Stamina
$895b,5c,5d ---> Charisma
$8aa6-$8aa9 ---> Experience
$8ac6 ---> Copper
$8ac0 ---> Gold
$8ac2 ---> Silver
$8aca ---> Gems
$8ace ---> Jewlery

I haven't tried them yet and probably won't try them at all.
I want to play such a great game like AR without tricks.
(IMHO)

Message-ID: <1992Jul21.204208.3040@news.ysu.edu>
Source record: 110349

I am getting pretty fed up with all this copy protection crap..
I have several programs that I would like to use on my Hard Drive
but because of these stupid protection schemes..well you know !
Here is a list of programs that I really would like to get onto
the HD:

1.)Planetarium
2.)Rambrandt
3.)Synfile
4.)Syncalc

I have all fo these in a form which will allow me to copy them to
the HD, but each one has it's own drawbacks when you try to use
it (reading only drive one, looking for support files on drive one,
etc.)

Can anyone tell me how to go about patching these suckers?

I have a Rambo 800xl..Black Box/Floppy board..xf551, and Doubled 1050..

I think that in general, we need to begin swapping ideas on this
topic. I think that many of us are reinventing the wheel when we
start writing patches that already exist..
Thanks

Hmmmm, I modified a Sega light gun to work with my 130XE, and it was a bit more complicated than that. I don't have the instructions handy, but it involved making a sort of adapter out of a joystick extension cord. More than two of the wires have to be rearranged. Another thing I remember is that when I first tried it on my XE, the gun would fire when I _released_ the trigger, not when I _pressed_ the trigger. The microswitch that the trigger actuates (what Mark calls a "trigger detector") was a NO (normally open) [or maybe a NC I don't recall exactly], and the Atari was expecting the opposite "signal", so I went to Radio Snack and bought the other type microswitch. It took a bit of kludging to get it mounted in the gun properly, but I did it. (What a way to spend a July 4th weekend!) Now I can blast barnyard beasties or shoot crossbow bolts to my heart's content (don't play them much anymore nowadays).

But by all means, folks, try Mark's mod. If it works, fine. If not, mail me and I'll upload and post the directions (they may be on atari.archive, I'm not about to look at the _huge_ Index now!). Of course, I could have spliced the wires, I just liked the "adapter" idea, but then had to change the switch anyway. Maybe some Sega l'guns are different...?

One of the local dealers sells converted Sega light guns for the 8-bit Ataris. If you would rather buy than hack (they're not outrageously expensive as I recall), mail me for the address/telno (he does a mail order business).

My 1050 gave up on me two weeks ago after 7 years of trouble free service. Not wanting to pay $65+ to get it fixed by a repair shop I ordered some chips from American T.V. and fixed the prob myself. The chip that went bum was the CO10745 1050 CPU chip. Could be the problem with yours.

<giggle> Noooooooo... STILL don't have Action!... (I'm REALLY waiting
for Quick, tho...heheh)

Anyways.... I've started this damned program over 100 times
(ok..about 5 or 6 :))

Anyways... I tried it in BASIC 2 or 3 times...then in Draper Pascal
(BIG was of 40 pages for the docs, since DP don't work w/MyDOS (too many
buffers allocated! SCREW YOU! If I set it down to 1 (maximum this thing
lets me use) you don't WORK RIGHT!!!!!!))... FINALLY I decided "hey, I
made a little textfile->BASIC translater that's structured & has
procedure calls and all that spiffy stuff I like in TBXL but don't have
in BASIC!"... so I loaded it up... tested it out (to see if I actually
implimented ALL the routines I had on my little list) and it worked! I
have yet to get anything accomplished, but I think once I remove ALL the
bugs (and be sure to end each statement w/a ":"!!..damned xlator DOESN'T
check for syntax!!) and get it to load up & not crash, I think I could
get this thing somewhere. Anyone care to see the sourcecode? (just for
fun... you might actually want a copy of the xlator program.... NOT!)

For now I've got a disk full of ".DAT" files for the BBS to load up
properly when run, a copy of source, a BASIC LISTing of it (that the
xlator makes..btw: xlators in basic!!..I run it in TBXL tho..for speed),
a BASIC SAVE of it, MyDOS, TBXL (to run the xlator), the xlator itself,
and TPX for editing the damned source and .DAT files.... took up half th
disk, but I don't think I'll be adding much to it very soon!!!

hmm... maybe I'd better get back to work on it! ;)

I looked at a Genesis controller, and it uses a quad 2-1 multiplexer: a single select line chooses what two other lines carry- A/B and C/start. I have no clue about the Nintendo, but I bet it's similar. I think the chip in the Genesis is a 74161.

I have been perusing 'Mapping...' and I am not sure I understand a few things.
There are Two memory locations that claim to be MEMTOP: 741,742 and 144,145.
What is the difference? Are they always the same?

As for the other locations, is this one possible configuration?

```
-----------------
| OS ROM |
----------------- RAMTOP (106)
| screen mem |
----------------- MEMTOP (741,742 or pg.0 144,145)
| Free Mem |
----------------- APPMHI (14,15)
| Basic Prog. |
----------------- MEMLO (743,744)
| Free mem |
----------------- LOMEM (128,129)
| DOS |
----------------- RAMLO (4,5)
| p.0 & OS RAM |
-----------------
```

Would this be correct for a possible memory set up? (ie. a user ML routine
between LOMEM and MEMLO).

Also: Does any know how to use the built in Relocatable Handler Routines
in the XL/XE OS?

Thanks a lot.......

There is a program that the magazines used to use to print out there listings, MegaFont. XLEnt Software has had many different release of MegaFont for the PC, 8bit and ST. The program allowed text to be printed out with virtually any charater set that can be created with an 8X8 matrix. The program included a font uploaded that uploaded character sets into the C.Itoh 8510 and Epson FX 80. The program also would print text files as graphics.

The program was part of XLEnt Software's Printware series which had a desktop publishing package called Typesetter, a toolkit for Printshop called Printshop Companion, Page Designer, and a package called Rubber Stamp that was designed to create lables and other small printouts.

XLEnt Software is still around. Their number is (703) 569-8881.

Message-ID: <0095DF7F16675880.206046BF@edinboro.edu>
Source record: 110266

Hi,

I am wondering how many people happen to own SDX (or other versions of Sparta DOS)? Since ICD refuses to release any specifics about SDX it would be nice to pool our knowlegde. I would like to start a little Sparta DOS FAQ that would include E-mail Addresses for regular users of Sparta DOS as well as any programming/use info that users may wish to post. I would be willing to periodically post (to c.s.a.8.) and update this info.
I would also like to maintain a small collection of Files that are for use with SD (utilities, demos, etc.).

If you own SDX (or any Sparta DOS) and are interested in this, please send me e-mail.

Things I am looking for:

E-mail addresses of Sparta DOS users.
Are you more interested in Development or Use.
What Version of Sparta DOS do you own.
What other 'Advanced Equipment' do you own? (Hard-Drive, MIO, BB, etc.)

Even if only 5-10 people are interested in this, it would be interesting. I think that between the many great minds of Atari Users, we could come up with a lot of information.

Peace, | '...expanding exponentially
-Adam Conover | like some recursive virus...'

Well... from what I recall when looking at some review of it in an OLD compute! or something.. it was supposedly a GREAT graphx/text adventure game and at least on the ST or Amiga screen (they only showed one pic) it had VERY nice looking graphics. It supposedly has about 200 peices of information for each object ...pretty much everything you see on the screen. It's not like one of those games with a picture of a chair on the screen and you say "take chair" and it says "there's no chair here!" because it doesn't KNOW that...even tho there's a picture of one right in front of you! Anyways... it looks like a pretty decent game. I'd look around for it myself, but I'm not into text adventures very much. If I came across it myself (for a DECENT price) and the graphics looked really good, I'd get it myself just to see HOW good it is on the 8-bits compared to what I read about it "in general"... if you like Zork & all those games, I'd suppose you'd really like it...

2920. 6502<-> 68881 Math Cop.

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-22 23:54:17 UTC
From: Jeff McWilliams <JJMCWILL@MTUS5.BITNET>
Message-ID: <92204.185417JJMCWILL@MTUS5.BITNET>
Source record: 110264

Well I got some Motorola databooks today. One was for the
68000 family. Included in there was some specs on the 68881
math coprocessor. Very interesting. The 68881 can act in either of
two ways, as a coprocessor, or as a peripheral processor.
The first way would apply to the 68881 being wired up with a 68020,
where the integration of the two is almost seamless, and the pair
can be thought of as one CPU, with floating point operands and
registers.

The second method, called peripheral processor, is so that the
68881 can interface to earlier 68xxx models, like the 68000 or 68008.
In this mode, communication between the 68881 and CPU takes place
by reading and writing to the 68881's registers, called Coprocessor
Interface Registers (CIRS) These are basically registers that you map
into the CPU's address space, much like you map a PIA (6520) registers
into the 6502's address space.

Another interesting feature of the 68881 is that it can be configured
to work with an 8 bit data bus, with some decrease in performance
as compared to its default 32 bit data bus configuration-- of course.

Additionally, the 68881 can have a separate clock attached to it,
running at either a faster or slower speed than the rest of the
system, due to the asynchronous nature of the chip.

The 68881 can also handle floating point numbers in either IEEE format
or a BCD format, much like the format used in the Atari 8 bit FP
OS routines.

What does this mean for us Atari classic users? That it is probably
technically quite possible to interface a math coprocessor such as
the 68881 to the 6502, even directly, without too much hassle.
The 68881 could be running at anywhere from 16.6 to 50 mHz and not
interfere with the 6502's required clock speed of 1.79mHz in the
Atari.

All that would need to be done is wire it in, and rewrite the OS
routines to communicate with the 68881 instead of doing all the
math at slooowww 1.79mHz through software approximations.

I don't have all the specifics on the 68881. The exact method of
using the CIR locations on the 68881 to get the job done wasn't
described in this manual, only 68020 floating point opcodes were
mentioned.

If a coprocessor card were designed on the Parallel Bus, as was
mentioned earlier, comprised of a 8mHz 65802 or 65816, then

the 68881 could be implemented in there as well. In fact, the
65802 and 65881 have a new OPCODE, called COP, for doing this.
COP causes the CPU to look to an interrupt called the coprocessor
interrupt, which is handled much like a IRQ interrupt, or NMI interrupt.
An operand byte following the COP instruction would indicate
what type of operation were to be executed. The COP interrupt handler
would look at the operand byte and then call the appropriate
function. The 68881 has a pin called SENSE' on it. Basically
it is attached to ground. By using a pull-up resistor on the
PC board, the sense line would be high if the 68881 were not present,
and low if it were. The COP interrupt handler could examine this
line, and either call the standard Atari OS floating point routines
and execute them at the CPU's speed of 8mHz, or it could
talk to the 68881 and have it do the high speed, accurate floating
point operation. Either way, the COP interrupt routine would
return with the result.

This would make for, in my opinion, an elegant and flexible design.
For those not wanting to churn out the bucks for the 68881, they
could have a coprocessor card that does floating point, and whatever
else, out there on the parallel bus, doing instructions at 8mHz instead
of 1.79mHz. If they choose to, they could later purchase and plug
in the 68881, and realize an additional increase in floating point
speed, making maybe even programs like ChromaCAD really fly.

Of course, there is no reason why the 68881 can't be hooked up to
the parallel bus directly, and then redo the OS ROM with the OS FP.
routines calling the 68881. The 68881 can still run at whatever speed
desirable, as mentioned above, due to its asynchronous nature.

I will be attempting to get further databooks on the 68881, to further
research this far-out idea. I don't have the capital to
actually start building one of these babies tomorrow, but at least
I can study the feasibility of such a grand project, and perhaps
see others further develop and implement the idea.

Comments and ideas encouraged.

Jeff McWilliams

2921. Modem still wanted!

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-23 04:08:54 UTC
From: cummins@a.cs.okstate.edu
Message-ID: <1992Jul23.040854.11854@a.cs.okstate.edu>
Source record: 110269

Got an SX212? An 850 or a P:r: connection you would like to see in use?
I have a newbie 8bit user that I can't get software to! If he can find
a cheap way to interface with a serial modem (or serial link) or a phone line
I'll cram the archives onto his floppies!

But he's not rich....
jc

2922. 1050 + software for sale

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-23 04:14:40 UTC
From: hong@cs.umd.edu
Message-ID: <59180@mimsy.umd.edu>
Source record: 110267

Well, I have a 1050 in good condition for sale: asking $55 + shipping.
I also have some software for sale:

Dark Crystal
Realm of impossibility,
Indus DOS XL + Data Manager + word processor + spread sheet
Flight simulator,
+ some wp, paint program + some books, email me for a list.

Price: for program with manual, I am asking for $3 per disk, and for
those without manuals, $2 per disk.

Buyer pays shipping.
Thanks,
Sze Hong

Mark Fontana writes:

>A few days ago, someone mentioned that you can skip levels in Miner 2049er
>by typing Big Five's phone number. I'd never heard of this before, so I
>loaded up the game and started messing with it, but couldn't get it to work.
>
>Could someone please explain precisely when and what I'm supposed to type?

First, let the "introduction" screen play long enough to actually see
where Big Five's telephone number comes up. Jot it down, WITH area code.

Then, while playing the game, type the digits of the telephone number,
with area code. No punctuation, just the ten digits themselves.

After that, you can hold down SHIFT-CONTROL plus any digit, and instantly
jump to that level. Voila!

(Incidentally, I remember once seeing a version of Miner 2049'er that someone
had hacked to provide an "intro screen" that let you give yourself as many
lives as you wanted and start on whatever level you wanted. I guess THAT
person didn't know the existing "cheat" either! :-))

(I find the SHIFT-CONTROL-digit thing handy when pressed the INSTANT I GET
KILLED, even just to re-invoke the level I just DIED on -- because you
don't get "deducted" one life and can play "forever." Hmm, maybe it's
actually that you have to press it the moment you see that you're GOING
to get killed (i.e. while in the midst of a fall from a height, before
actual impact.)

Enjoy!

I use SDX, although not as often as some people nor even as often as I once did.

I also have an example somewhere that shows SDX's XIO commands, from BASIC, misbehaving as compared to running the same program under Atari DOS. Remind me via e-mail if there's any interest; it'll take me a while to find it.

Huh? So? I just run the file conversion utility and viola... it
works.

Here's an example of an incompatible format.
Try using a DOS 2.0D in a 810 or 1050 drive. Or using a DSDD disk
formatted on an XF551 drive on an 810 or 1050. The 810 and 1050
can't read the disk because of the double density format.

Actually, according to the manual I have, it only supports things like
STZ, ADC (ZP), and a few others. It does not implement the BBS 0-7,branch
or the BBR, or TSB, TRB opcodes. I have a hacked version of ra65 which
supports these, but I have never tested my additions. (I added the feature
less than a month ago).

This was not necessary - according to the Antic/Analog?? article that gave
the instructions for modifying the Sega light gun the only change to the
trigger mechanism was to swap a few wires - how do I know?, because I have
a working Sega light gun which plugs directly into the joystick port of my
130XE. Also I recall that I didn't have to fool with a joystick extension
card either. I remember taking the gun part and removing entirely the Sega
cord by desoldering the wires - I then used a Radio Shack joystick extension
cable with the female end cut off and soldered this cable to the proper points
in the Sega Light gun. Then I switched the trigger wires, put the case back
together and tried "Barnyard Blaster".

If anybody is interested I can dig up the Antic/Analog (most likely it was
Analog) article and post a synopsis.

Thanks for the replies about how to skip levels in Miner 2049er. It was fun to finally see those levels that had sat latent for nearly 10 years!

It would be nice to have an archive site for some of these classic games, if someone could work out the legal mess once and for all. The amount of fun you can pack into one megabyte of disk space is incredible. (Compare this with the average IBM game :)

I'd like to find a copy of Koronis Rift to use with SIO2PC. My original boot disk now makes that lovely "blip--- blip---- blip----" sound.

Mark

2937. sio2pc file utility uploaded to archive

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-23 18:08:03 UTC
From: tgreen@iastate.edu
Message-ID: <tgreen.711914883@vincent1.iastate.edu>
Source record: 110283

I finally got around to putting my sio2pc file utility
program on the archive. It's actually not quite done
yet, but it is usable. The files are s2pc.exe (ibm executable),
and s2pc.txt (ascii text description). It works for mydos and
atari dos disk images.

If you use it, I'd like to hear for you - any problems, suggestions,
or whatever. It's free, but if you feel you must, I'll accept
donations :-)

Hmmm.. I never popped open the Genesis controller that I used on my
8-bit (at the time praying that sparks werent about to fly!) but I did
notice that from what >I< tried.. yeah, only B & C worked. So what way
would it tell the system that A or Start are being pressed..? Anyone
mess with this??

>Daisy Dot III - better than Word Perfect in my opinion!!
>-----
>Posted by BBS User: James King

There are a couple of utility programs that create "fonts"
representing the desired picture or icon. To incorporate the
graphics, you set the line spacing to 0 and the character spacing to 0
and then type the corresponding characters. For example, if the
utility program creates a 96 X 96 graphic, it could store the data in
the characters in the characters A through I. To include the graphic
in your document, you'd type:

```
\S0\XV00
ABC
DEF
GHI
```

Not the most elegant method, but the results can be very impressive.

Remember when there was a big movement to see if the old games had been released into the public domain (or to get the companies to do so)? Well, my results after contacting numerous companies were:
No reply.
No way.
Thanks for the suggestion, but it is not feasible.
And finally, (from Sierra): we would have to support them still, so we will not do so. However, our first adventure is in the public domain. (I don't remember the name of it.)

So... it looks like you won't get any condoned copying. However, I wouldn't let that stop you. These companies obviously aren't making any sales to this arena anymore, so it doesn't make any difference.

If you can find it for sale, buy it. If not, copy it.
I hope to establish a "clearinghouse" for orphan software RSN...

Jeff

Source record: 110291

In article <Jul.23.10.46.32.1992.6718@electron.rutgers.edu>,
chase@electron.rutgers.edu (Kevin Chase) says:
>
>Actually, according to the manual I have, it only supports things like
>STZ, ADC (ZP), and a few others. It does not implement the BBS 0-7,branch
>or the BBR, or TSB, TRB opcodes. I have a hacked version of ra65 which
>supports these, but I have never tested my additions. (I added the feature
>less than a month ago).

According to my manual, which is revision 1.2, and comes paper
bound with 3 holes in its edges, and a yellow cart., MAC/65
supports the following:

Indirect addressing, via LDA (indirect)

which is the same as LDY #0
LDA (indirect),Y

the BIT instruction has two new modes,

BIT absolute,X
BIT zeropage,X

and adds JMP (indirect,X) as well.

further, new OPCODES are supported:

BRA, DEA, INA, PHX, PHY, PLX, PLY, STZ, TRB and TSB

Note: There are two different 65C02 processors, the one mentioned and
supported by MAC/65 is made by NCR. Well, according to "Programming
the 65816, including the 6502, 65C02, and 65802" this chip is
originally from WDC.

Rockwell made a different 65C02, with different instructions and
enhancements, as follows:

BBR Branch if Bit Reset
BBS Branch if Bit Set
RMB Reset memory bit
SMB Set memory bit

The Rockwell R65C02 also supports the NCR or WDC 65C02 instructions
and addressing modes, making the R65C02 instruction set a superset
of the W65C02. So, actually your presumption that MAC/65 doesn't
support the 65C02 fully is incorrect, it just depends on what
65C02 you are talking about!

Well, the ol' Alchemist brought up an interesting point (about the spare Tandon mechanisms - I gather that most/all 1050's use these, i.e. if one has a spare mech from American Tech.-V. for a 1050, it's a Tandon?). Our (SCAT's) 8-bit librarian bought one of those mechs, and put it in, and her previously dead 1050 worked for a short (?) time, but then stopped working (dead, as I understand it). I paid her a visit to drop off a submission (to the library), and we took the 1050 apart, and I poked at the chips (but didn't reseat them because I didn't know how to remove the board; but I noticed that one or two connectors seemed loose. I pushed it/them back in tighter, and we tried the 1050 with half the case on (as I recall) - and it worked. But when we put the whole thing together, it died again.
Now, her husband won't let her sink any more $$ into 8-bit eqpt repairs (they are going to get her a PC- compatible :-/). Any suggestions for fixing this thing for (almost) free? That is, is there anything a non-electronics-tech (I'm really a s/w person) can do to fix this?

Thanks for any help,

Nick DiMasi

To those of you who thought that the modems didnt have a volume pot in them are wrong. I just discovered it while taking my modem apart. The problem is the hole in the PC board is too small to fit a screwdriver in. So unless you have a real long and narrow screwdriver that could fit though the hole, youll have to get the thing apart to change volume. Also as with most atari products, theres metal sheilding to take off as well.

Actually there is a very good reason to upgrade a 1050 drive - speed.

Aside from better organized storage with SpartaDOS (subdirectories, etc.) the single best thing about this DOS is drive speed. Once you get used to read and writes occuring in 1/3 of the time (including boots) you'll never want to wait while a stock 1050 grinds it out again.

AND if you go all the way to SpartaDOS X on a XL/XE with more than 128K you will find the most memory available of any DOS. This is really nice for applications that dynamically use RAM for a buffer like TextPro.

Also, in terms of just buying more disks - some of the graphics packages limit you to the number of images that fit on one disk (like Print Power), therfore the more disk space available, the more images you can work with.

That's probably the easiest way to do it. The Black Box interface lets you define up to 96 partitions for this purpose. I have an MIO (256k) and a 20 meg HD, and I don't often bother with boot disk programs. When I do, I just boot from the floppy.

Hi, this is my first post to c.s.a.8, I've read the group for some time, and I've thoroughly enjoyed every minute of it. But on to the subject at hand.

After about a four year hiatus, I've setup my 8 bit and I've taken it upon myself to rediscover this wonderful machine. Looking through my software, I've come across one that puzzles me. I have the disk version of Blue Max and I recall how to do everything except the key(s) to press when I come to a runway and want to land.

I haven't played this game in some time and my memory is fuzzy. Let me tell you, this is the original disk, not a copy, and I have misplaced (read lost) the manual, so no flames please.

Any help is greatly appreciated.

> Thorn EMI War Games

Well I have Thorn EMI's Computer War cartridge (THA12010) which definitely seems based on the movie War Games and I am wondering if these are the same game. Did Thorn EMI release it as "War Games" and get into trademark/copyright troubles and change the name?

I haven't played "Computer War" in years put as I remember you are shown a map of the US showing missle tracks coming in, you selected one of the missles and were put in a gun turrent with a somewhat 3-D view where you could turn the turrent left-right and move the gun up and down to try and shoot down the missle zipping across the screen. Each missle you failed to shoot down raised failed to shoot down raised your DEFCON level by one and if it reached DEFCON 5 thermo-nuclear war borke out and you lost. There may have been some kind of "bonus" round but I don't remember for sure. Anyway does this sound like the same game as "War Games"? --Kent

Amazing. Not only are you offering to pirate software and telling other people to do so, but you're actually offering to do this for people. Not for free, I'm sure. How much do you plan to charge people for this? Do you plan on sending any of the profits to the original companies like Sierra or are you gonna bag all the profits yourself.

Hey, I have another profitable idea for you. Break into warehouses and storage lockers and steal the merchandise and re-sell it. Heck, go and break into people's home during the day when they're not there. After all, they're not using at the moment. They don't need the stuff!

Let's forget the fact that the people will come home and want to use it. Let's ignore the possibility that this software may at some time be repackaged or brought to market again. Let's forget that somebody still owns the rights to that code.

And give me a break. You 8-bit users are all pirates anyway, even though only Jeff here will admit it in public. You want me to believe that your typical Joe 6 Pack Atari user will be able to _only_ pirate software that is no longer in production and refrain from pirating software that is. Like your average user will _know_ which software it's "ok" to pirate and which it isn't.

BULL****!!!! You are a complete disgrace to the Atari community. I hope you not only get sued by every 8-bit software developer past and present but that you lose your net privilidges as well. You're also pretty stupid. By blatantly offering your piracy services in public, you're opening yourself for all sorts of trouble. Moron.

Source record: 110221
Cross-posted to: rec.games.video,comp.sys.atari.8bit,comp.sys.atari.st

Here's what ANTIC says about the Sega gun being used on the 8-bits.

from: "First Look Inside the XE Game System," ANTIC V7,#4, Aug.1988, p.42

"..If you're tired of waiting, you may wish to pick up the Sega light gun
for about $25 (when on sale) and modify it for the Atari.
" To modify the Sega gun for the Atari, you'll have to cut off the
incompatible connector. The wires must be stripped back and soldered
into an Atari joystick connector as follows:
SEGA GUN ATARI JOYSTICK PORT
Blue wire Pin 1 stick FWD
Gray wire Pin 6 trigger
Green wire Pin 7 +5 volts
Black wire Pin 8 ground
" Because of the close-fitting connections for the XEGS ports, don't
wire in a DB9 female connector that has "ears." Most joysticks don't
have wires for unused signals, so cutting up an old joystick may not
work. Specifically, an Atari joystick does not need the +5 volts, so
there isn't likely to be a wire connected to Pin 7. Howeverm you can find
joystick extension cables at Radio Shack [I don't think this is true
these days...check MCM Electronics...], which have all nine pins wired
from male to female. [...Antic disclaimed responsibility for damages or
deaths...hehe]
" Once it's all hooked up, you'll notice that the gun fires when you
/release/ the trigger, which is annoying. The Sega trigger wiring is the
opposite of what the Atari light gun uses. To rewire the trigger switch,
remove the five screws (one is under the Sega logo on the side). Find the
trigger micro switch with three connections. Wire to the normally
/closed/ contacts instead of the normally open."

There ya go. Sounds like a bit of work, but I suppose it's worth it.
Does anyone know if the Genesis has a seperate light gun and if it works
identical to the Masters or what??

later

I got a call from David Richardson a day or two ago (he was verifying my address) and is going to send me 5 disks worth of ARCed files - unARCed size being >9< disks!!! which describes how to add pictures to text files and I suppose has examples (he says there are over 100 fonts on these disks). Anyways.. what he says to do is unARC them all, then go into DDIII's PP.COM and go thru EVERY SINGLE text file on each disk!!!! He says the docs come out to be about 47 pages. WHEW! Welp... I got some disks ready to be mailed out to him so he can mail 'em back with the ARCs on 'em... THis'll be fun! :)

One thing he said tho is there's probably 20 copies of some of the fonts because they're used thruout the entire text. WHY!? Why wasn't DDIII made to be disk-swapable!? Instead of having each disk w/ a copy of a font, just have it on one disk and when the PP.COM file reads from the text to change fonts, and it sees that it can't, it should request a disk swap! SIMPLE! Sure, you'd have to hang around the computer all the time, but I have to anyways because the paper I use in my printer likes to jam if it's not seen to every once in a while...

Oh well... one day that'll hopefully be fixed.

Oh..just as a note David & I got into talking about Graphics 9 dumping (which he says this can do) and said he's made plenty of ColrView digitized pictures with ComputerEyes... he also plays with GIFs alot... he got an IBM just to look at the GIFs... how ironic that an 8-bitter gets an IBM JUST to help out the 8-bit! <snicker!>

I basically agree with you, or at least I think I do since you
didn't provide too much in the way of factual information. But this
statement:

>And give me a break. You 8-bit users are all pirates anyway, even though
>only Jeff here will admit it in public. You want me to believe that

is a personal insult to a great many of us, and it's flat wrong.

Perhaps when you've cooled down a bit you might explain your opinion
on the issue in a more effective manner, without resorting to
categorical name-calling. If you do so I just may forgive you.

Get a clue! Read what's posted! Jeff in no way offered to help pirate software. My understanding of his post (though I admit it was a bit vague) was that he would act as a middleman for people who had legal copies of software that they wanted to sell. In effect, eliminating the excuse that the programs aren't being sold.

>pirate and which it isn't.

So you're not an 8-bit user? Then what are you doing here in the first place? Actually, I suspect you've got an 8-bit with hundreds of pirated games and you're feeling a bit guilty, so you're releasing that guilt by flaming others who do what you do yourself. See a phschiatrist.

Actually, you did actually bring up (by accident, of course) one legitimate point. You refer to software that is still in production. Is there any? Any at all? Is there even one company that is still producing software

for the 8-bits? (I'm not talking about stuff sitting on store shelves for years, I want to know if there's still anything in PRODUCTION.) Furthermore, does anyone really believe that any of the old 8-bit software that is no longer on the market will ever be re-released for the 8-bits? I didn't think so.

2966. RE: Old Software

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-25 06:39:43 UTC
From: Jeff McWilliams <JJMCWILL@MTUS5.BITNET>
Message-ID: <92207.013943JJMCWILL@MTUS5.BITNET>
Source record: 110212

First, to answer Preston Crow's question, absolutely, there ARE places still producing software. This includes Chroma-CAD, and I believe there is a company called Software Infinity who sells imported games software here in the U.S. I believe it was Rick Reaser who recently wrote in his Editorial article in Current Notes that Steve Hoffee was looking into importing other products from Peru, but that it would probably not happen, because the market here for 8 bit products is horribly flat compared to other places. Additionally, there is the new language called Quick from Germany. Marek Tomczyk (spelling?) commented that a book on this language will also be published soon. These are from a German company called Power Per Post. So yes, absolutely, there is software out there being developed.

Now regarding Darek's comments, I think he does have a legitimate concern that such an offer could turn into a Piracy ring. Legally speaking, even though the software is no longer being distrubuted, it still is copyrighted. But I also have some mixed feelings about this. As software disappears off of the shelves of distributors and resellers, where will users go for the programs they may need? Right now there are some excellent programs, not just games, that I would like to see for sale again. I recenlty purchased a used official copy of Paperclip, and I think that barring its 40 column display, it is one of the most complex, yet easy to use full featured word processors available for the 8 bit. It's a shame it's no longer available, those who haven't seen or tried it don't know what they are missing.

Darek's labelling of the entire 8 bit community as pirates was an unjust act. It simply isn't so. I'm not a pirate. I WAS a pirate, in fact I wrote an article about anti-piracy titled "I was a Teenage Pirate" in an issue of Michigan Atari Magazine way back when, when I had recently converted from piracy to anti piracy. I think Historically, 8 bit users were pirates, or many of them were. Look at the number of back-up hardware and software products out on the market.
Sure, a good deal of those were used strictly for archival backup purposes, but from experience, I know of two people, one was my older brother, who bought copying devices for the exclusive purpose of copying and trading software. But it's not like the 8 bit community is a cult of paganistic worshippers among a host of religiously correct people. My older brother used to compete against a friend Commodore computer owner to see who could amass the largest amount of pirated software. There is right now a guy who lives across the street from me who had a Beta copy of MS-Windows 3.1 before the official release was out on the shelves. I've worked in offices as an aid where Macintosh software was casually distributed to everyone's machine, without there being a group license or any other legal reason for their doing so. I remember several years back a store was busted for selling PC clones with all sorts of commercial software, Lotus 123, Dbase, etc. being put on the hard disk for free, illegally, as

an incentive to buy the machine. A friend of mine went 386 shopping last fall, I was there when the Mail order dealer on the other end of the line offered to put an illegal copy of DOS 5.0 on the Hard Drive, to shave $50.00 off of the cost of the machine. My friend turned it down, but he does run an illegal copy of Autocad on his machine, as well as Wordperfect.
So please don't look down upon us as from Mount Olympus, declaring us heathens unworthy of oxygen.

The Atari 8 bit community has a legitimate problem: both harware and software sources are drying up, while there is still demand for them.
So far, no one has offered an easy solution to the problem. It would have been terrific if the software companies would have released their programs from copyright, or Atari made amends for dropping the 8 bit line by putting their programs into the Public Domain. It didn't happen though, and perhaps it was unrealistic for us to expect them to do so.
We're getting caught between a rock and a hard place here, and in desperation, people are trying to come up with ANY idea that will help eleviate the problem.

I don't have any answers myself, and perhaps Jeff's idea deserves some criticism for sounding like an offer for a orgy-like piracy free for all.
But the criticism Darek offered was a little harsh.

If the rest of the Atari 8 bit world is legitimately interested in keeping what dealers and developers we have alive, then pledge your loyalty with the dollar. There are places that do still sell old software, and I mentioned a few examples of developers who are still creating new products. Buy their stuff, write them letters, saying, if nothing else, just that you think their programs are good, or maybe not so good, but that you are still interested and would like to see continued support from them. If you think their programs aren't so hot, offer some constructive criticism. If you really like the program, then perhaps you should write a review, or maybe just post a message on the Internet saying, "Quick is great! Buy it if you can!" I personally know one guy who is working on some new software, a game or two, and some other innovative products. His decision to release and continue to improve these programs will depend on his initial success in selling the first few offerings. There are probably others in the same situation, like the author of ChromaCAD.

Let's not have a flame war about all this. There are enough in other groups, including the ST one. When it happens, I get this bile like taste in my mouth, and begin to get disgusted. I just want to turn the computer off, and wish the hot-headed people would go away, and leave us alone. I think the participants of C.S.A.8. should be proud of themselves. Despite of all that has happened to them, there has been little in terms of flame wars, Atari bashing, or ST bashing from this group. I think it reflects on the overall maturity and level-headedness of the people here. That is a good thing in my book. If more people in the world spent less time fighting and more time grouping together to solve problems, the world would be a heck of a place. Maybe not the garden of Eden, but it would be better.

Let's keep ourselves focused on the betterment of the 8 bit community,
and restrain from arguments.

Well, my soapbox time is over, thanks to all for listening.

Source record: 110214

I'm working on a concentration puzzle game that will incorporate selectable Graphics 9 digitized (or not) images (shrunk to 1/16th screen size... auto shrinker included) and probably digitized sound samples. Whenever you match two peices, you'll hear a certain sound for that image (ie, if one were to include a Madonna picture and a Paula Abdul picture you'd have a little bit of a Madonna song when you match the Madonna images, and a little bit of a Paula song when you match her's...)

ANYways... any suggestions on how to make this? I decided against using APAC or APAC-2 modes for now, because the squashed images look pretty bad as they are (then again, the one's I've shrunk are all images I've made myself, which don't look the best anyways.) If I knew how/had some code that installed Pryzm (aka Interlaced APAC) mode, I'd eagerly use it (wasting a little more RAM, but oh well ;^]) but for now it's just black & white. (maybe I'll add a nice rainbowy multiple-DLI for a touch of color???) WOuld anyone even want to play something like this???

2968. Hardware Questions

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-25 09:28:01 UTC
From: Jeff McWilliams <JJMCWILL@MTUS5.BITNET>
Message-ID: <92207.042801JJMCWILL@MTUS5.BITNET>
Source record: 110213

Some hardware questions, that maybe someone more inclined toward hardware
than myself (yikes!) can answer:

1) Does anyone know of a source for a prototyping card, like the apple
cards, but with an edge connector containing 25 connecions per side,
that will mate with a 50 conductor ribbon cable IDC edgecard connector?

2) Does anyone know exactly what the differences are between a standard
6502 and Atari's 6502C used in the XL/XE computers? i.e. exactly
what did they change, and therefore what would need to be added
to say, a 65C02, to plug wire it into an XL/XE?

Thanks for the help folks!

Jeff McWilliams

Looking through the catalogs for the some of the local (Vancouver) supply houses, I don't see anything with 50 conductor card edges. Lots of 56's, though. You could saw/file a 56 down to a 50 without much trouble, although I wouldn't want to do a large quantity by hand.

> 2) Does anyone know exactly what the differences are between a standard

Ack, I lent my Sams Photofax schematics on the XL/XE's to a friend last year, and I still haven't seen them back. :(

Do you have a copy of the Hardware Manual? If so, turn to the schematic of the old (rev A) CPU board with the true 6502. Note these two TTL parts:

Z301 - 74LS02 quad nor gate
Z302 - 7474 dual D-type flipflop with preset and clear

I'm not exactly sure how this stuff works. Digging around with a scope would tell the full story. But it looks like Antic generates clk0 and -halt. These are massaged by the TTL parts into clk0 for the CPU, as well as clk1, clk2 and r/-w for the rest of the system. This stuff is basically glue to allow Antic to take over the bus cleanly during Antic's DMA. The CPU-generated clk1 and clk2 aren't connected, since they would contain wierd burps whenever Antic went after the bus.

Since I'm without XL/XE schematics, I don't have anything on the 6502C. But from memory, this clock stuff is what was moved to the 6502C chip.

I'd guess that those two chips are all that is needed parts-wise to get a R65C02 into an XL/XE. The problem is... you won't find everything you need on the CPU socket, so a simple daughtercard won't work. You'll have to cut a few traces on the motherboard and run lines to the daughtercard.

I took the easy route out on my 400. I found someone with a rev A CPU board in his 800 who didn't care about CPU upgrades and swapped cards with him. Then I stuck in a 3 MHz R65C02 (same price as the 2 MHz part, still ran at 1.79.) But after a bit of playing, I went back to the trusty XL... I preferred Sparta 3.2, and I hated the 400's keyboard. :)

Source record: 110219

I don't want to beat a dead horse or flame anyone, but Jeff is right.
I bought my first Atari in 1981. A 400 w/48k, 810 drive, 410 recorder and a couple of games and the BASIC Programmer package. (A *large* box with the BASIC cart and manuals.) It wan't until 1988 that I ever had one piece of pirated software. I had a Happy installed in 1986 to back up everything for myself alone.
In February of 1990, I bought a Packard Bell 386sx and didn't even have it a whole week before I managed to be given several illegal copies of PC software. I have a rather large collection of the stuff now and don't use any of it. But my point is this; the Atari 8 bit users are not as bad as they have been made out to be. Just because there was a lot of hardware/software made for copying stuff doesn't mean a thing. Commodore had its share of same and you can still buy stuff for that machine today. I've read magazines for the 8 bit with articles concerning piracy actually laying the blame for no software on some sort of conspiracy by the develepors to make the Atari community an example by not producing stuff for it. Sort of like, "see, if you pirate this is what will happen to you." I don't believe that at all. But it is tolerated to an extent on the clone platform because of the sheer number of machines that are installed. I love my Atari, but if I can't legally buy a piece of software then I will gladly take a pirated copy. The notion that there are developers in Europe and Peru still making stuff for the Atari doesn't make me feel better either. It's not easy to get and it's not the stuff that I want. (mostly) What I want is the stuff that was made and isn't even being sold from musty old shelves at American T.V. or the like. If the copyright holders won't allow the stuff to be released then what am I supposed to do? If you look in the big Sears catalog, you will see that they are selling parts for autos that were made in the 1930's. Do you suppose they had to ask Ford or whoever for permission to make/sell a part for an auto that is no longer in production?
I've been through the same hassle of trying to find the copyright holder of particular programs and met with little or no success in some instances and with others the answer was the same as the original poster of this subject. "No way." I had the same idea (be a source for old software) and was going to make it a virtually non-profit venture on my part. Royalties and fees would of course go to the proper people. They just don't want to hear it. I wish any poor sucker that tries to do the same immense luck if they try to do the same. The number of copyright holders that will even deign to discuss the issue with you will number less than five. I am talking about the old "classic" stuff. I don't know what sort of experiences Darek has had, but it sounds like he lost some money some where and still holds it against the Atari community at large. Well, I've lost money too Darek. We can't all get rich off of a machine that was destined to all but disappear.

Since 1981 and my first Atari, I now own two additional 400's, two 800xl's and a 130xe, an XF551 and two 1050 drives. I bought all but the extra 400's at retail and not some clearance sale. I forgot the printers that I have gone through. Two Atari printers and an Epson and a Star Micronics. The amount of software that I purchased was enormous. I contributed monetarily to the wealth of Atari and its software producers. Now they have abandoned us to go on to drink from another well. That well will run dry also eventually and will in turn be abandoned. I don't believe in piracy but I *do* believe that if a particular piece of software is not available for sale anywhere in _this_ country then the acquisition of same by whatever means is not hurting anyone.
I think I've blathered on long enough, but you can bet that this subject will continue to come up with the same old arguments and wild accusations. To what end? It's certainly not going to make time go backward and make things like they were in the early 80's. Face it. We're dead in the water and any piece of useable flotsam that drifts our way whether legal or not isn't going to make one whit of difference.

To whover asked about the PSAN (Puget Sound Atari News) newsletter, I just happened to have an April 1990 copy on my desk (the rest are God only knows where) and can give you the following:

Jim Chapman (coordinator) (206) 566-1703

I don't know if he's still at that number, so here's some BBS numbers that are connected with S*P*A*C*E and PSAN:

The Reef BBS: (206) 848-3371
Cave Creek BBS: " 783-5867
Sub S*P*A*C*E BBS: " 756-8122

One other indivudual that would be helpful is:

Jeff Fehr (S*P*A*C*E librarian) at (206) 473-0709.

And for the hell of it, a nice underground Atari BBS:

The Great Gig (206) 448-7460

Hope this helps.

Since I have been unable to send any e-mail, I'd thought I'd post this direct.

I own several versions of SpartaDOS from version 1.1 to 4.20 (the X cart). It is my DOS of choice and I use it daily, along with around 250 utilities (most pertaining to 3.2d, but work well with the X cart).

As an example, I found a bug in the X cart yesterday, that pertains to the command.com module in the cart. Just fiddling around I turned on my system (Newell 1 MEG 800XL, 1 MEG MIO, and hard drive, and typed the following:

```
TIME
DATE
KEY ON
COMMAND
PATH ON
IBM ON
?
```

After hitting return on the question mark line, the system locked up. It locked up 5 out of 5 times.

BTW, I did mention that I have several versions, but didn't list which ones or a full list of equipment, so I'll do that now:

SpartaDOS: X32C, X32D, X32X (MODIFIED), XC23C, XC23E, XD23C, XD23E.
Also SpartaDOS version 1.1

Equipment used: ! MEG 800XL, 320K XE, 1 meg MIO, Hard drive set up contains 2 hard drives - Seagate ST-251-MLC-0 and ST-251-1, a Citizen 120D printer and a ATD 2400 baud modem.

Hmm. Talk about moronic posts. Granted, pirating hurts everyone, but when the companies are no longer in business or no longer carry (sell, manufacture, publish, ad nauseum) 8 bit titles - what then? Do those titles simply just disappear? I seriously doubt that anyone will pursue 8 bit pirates at this specific day and age - as most business's that DID create 8 bit stuff are no longer making money on them and its simply not worth the hassle and expense.

Tom ,

Hmmm, interesting. Okay, I will have to continue to look into this.
I have the Tech Ref notes, and am getting a SAMS manual for the XL from
a generous soul here on the Internet.

Roger on the 56 connector cards, Dataque's T816 board uses a 50 pin
connector which allows you to plug in memory cards, etc to it.
I have a 256K SRAM card and a clock card, but would like to prototype
my own stuff someday on it, by plugging a prototyping board into
the cable as well. That way I could fool with other things on it.

For that reason, modifying a 56 cond. board wouldn't be too much hassle.

Thanks!

Jeff

IF I remember right, all you have to do is press the joystick button after the high pitch runway "Warbal" sound and your speed will automaticly decrease.
Hope this helps.

>Wowl... level ZERO? Never saw THAT one. Do you remember what the layout
>was like?

Actually, it was ZONE 0. The layouts were identical, but I vaguely recall that your "life dots" extended much farther across the top of the screen and your time limit was unusually high. But then again, I only saw it once by PURE accident, back in 1984, and haven't been able to recreate it since. :-(I do know for certain that Zone 0 was much easier than Zone 1 (which makes sense ;-).

>As I remember, typing SHIFT-CONTROL-0 in "cheat mode" took you to level

I've never seem one of those before. Does it connect to the PBI, or on the motherboard CPU socket? If the latter, which is what I'd guess, does it involve various jumpers?

> I have a 256K SRAM card and a clock card, but would like to prototype

Hi all! The past week my 8-bit setup has been acting up. The
modem dials out and connects fine, but after receiving a few
lines of text, it just drops carrier. This happens until
everything has been turned on for about 10 minutes; then
the problem goes away and it works fine. My setup includes
an 800xl, PR Connection and SX212 modem. I find it most
likely that the modem is at fault, and I don't really care
about having to replace it...but I just wanted to check here
real quick and see if anybody thinks it might be the 800xl
or the PR that is at fault, or if anybody has experienced the
same thing on their system. Thanks in advance for any input.

I must agree with your statements, due to the fact that I for one have spent since my intorduction to the Atari 8-bit over $1200.00 in all types of software and still keep up with vendors who are selling the software to try to keep something alive for the Atari 8-bit. I've also made MANY purchases at my local user group and they have aided me greatly in being able to purchase software.

Do these access "D:" as drive one or "D1:" as drive one? (some
programmers are lazy and assume that you're using DOS 2.5 or something
close in which "D:" could ONLY be drive one)
If the program DOES access "D:" then it's just a simple case of changing
the working directory "CWD <dir>" in SpartaDOS - not sure about SDX tho;
or in MyDOS use [R] (or was it [Q]?) to "pick default directory." In
both cases whenever "D:" is accessed it acts like how it's set. (oops..
BTW: in SpartaDOS, just type "Dx:" to change the drive NUMBER and "CWD"
to change DIRECTORIES. In MyDOS the same command does both)
Anyways. From there whenever you're prompted from within the program for
a filename, if it's smart it'll stick a "D:" in the front of it if no
drive is given. This means all your working files for this program are
in it's directory/on the same drive. If you DON'T want this, just add a
"Dx:" at the beginning.

IF, however, the program DOES use "D1:" (waste of 1 byte every time it's
used!!! ;)) then my best feeble suggestion would be to get out a good
old sector editor (which, BTW: I am without!!!) and change all occurences
of "D1:" to something like "DD:" or "Dx:" (x being your new drive/hard
drive number...remember it's unchangeable unless you go around editing it
every time... just use SpartaDOS or MyDOS and "DD:"). I've only tested
"DD:" with MyDOS. I used BobTerm to play with it while I was online.. so
don't trust this 100%. Play with it first. If it works, go in and edit
your program (SAVE THE ORIGINAL!!!!!!!!!).

I do think, however, that most programmers were lazy enough ;) to say
"D:" instead of "D1:" back in the good old days of non-directory DOSes...

2997. Piracy, morals and Microsoft employees

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-27 04:26:55 UTC
From: conklin@theclub.UUCP
Message-ID: <9207270426.AA26561@frith.egr.msu.edu>
Source record: 110239

It's worthy of note that the entire piracy issue could be moot, since some of the copyrighted titles involved may be beyond the lifetime of Copyright. (Lifetime of copyright? There have been court decisions along these lines) Further, if fair effort has been made identify the legal holders of the copyright, and the holder of that copyright no longer exists and the copyright wasn't explicitly transferred then the expression of the work falls into the public domain. Basically, a non-existent corporation can't hold a copyright.

Another factor worthy of note - most Atari products weren't licensed. If you look at, say, a Microsoft product, you'll note that you never OWN the product. Your purchase is a license to use. If the product were actually sold, then you would _own_ the product and the vendor would have no right to dicate the terms by which you used it. However, Atari products were sold long before this distinction was recognized and thus are not restricted in the same way modern products are.

Back in the real world, (the legal world is so enfused with lies as to not qualify,) you have a problem of reason versus the law. The law clearly supports Derek's position, but the law in my town also states that anyone can file a noise complaint at ANY time no matter what the volume level and you MUST comply. Certainly, these laws have some real purpose, but the letter of the law isn't the intended use of the law. Unfortunately, writing laws that come out like their intent seems impossible, something that lawyers (and Derek, it seems) (ab)use to their heart's content.

Not to be callous, I must admit Derek comes across like the Serbs declaring that feeding starving Croatians is a crime.

Well, I have been out of the 8-bit world for a while (please, no flames, I'm just saying that to explain my lack of expertise!!) but I thought the SX212 has both the RS232 connection and a standard Atari SIO connection. It so, it seems that if you used that directly, instead of going through your P:R:, you could at least see if it was the P:R: that was acting up... Talking of strange P:R:'s, the one I had broke one day and dropped the 8th bit of every character coming in the serial port, so any EVEN Atascii character came through okay, but and ODD numbered Atascii character displayed as the char. before it... Talk about headaches trying to figure out what happened!! I musta spent hours messing with parity, data bits, etc... Geez!

Steve Lin

2999. Re: 8-bit/modem/PR question

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-27 06:37:48 UTC
From: crow@coos.dartmouth.edu
Message-ID: <1992Jul27.063748.5935@dartvax.dartmouth.edu>
Source record: 110245

Well, I don't have any of your problems (or equipment, other than the 800XL), but I would guess that it's the modem. My 1030 started acting up a few years back--it still works, but (well, it's been a long time) I think the lights stay on even when it's not connected and it does a few other things weirdly. My understanding is that while my power cords are plugged into a surge protector, this does little (as in nothing) to protect the modem from spikes on the phone line. My brother had his whole system fried by a lightening strike on the phone line (if I remember that one correctly...).

I believe that you can get surge protectors for phone lines as well, though I suspect that dangerous spikes are much more rare or we would hear more about them.

I hope these shared experiences will be found to be helpful by someone.

3000. Re: Piracy, morals and Microsoft employees

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-27 06:51:38 UTC
From: crow@coos.dartmouth.edu
Message-ID: <1992Jul27.065138.6150@dartvax.dartmouth.edu>
Source record: 110246

In <9207270426.AA26561@frith.egr.msu.edu> conklin@theclub.UUCP writes:

>It's worthy of note that the entire piracy issue could be moot, since some of
>the copyrighted titles involved may be beyond the lifetime of Copyright.
>(Lifetime of copyright? There have been court decisions along these lines)

I believe that with a revision to the laws in 1978 (which would cover most
if not all Atari software), copyrights last until the holder dies or, for
corporatly held copyrights, 100 years. I may not be remembering this
exactly, but assuming that most of the programmers are still alive, then
the copyrights are still very valid.

>Further, if fair effort has been made identify the legal holders of the
>copyright, and the holder of that copyright no longer exists and the
>copyright wasn't explicitly transferred then the expression of the work
>falls into the public domain. Basically, a non-existent corporation can't
>hold a copyright.

You may have a point here, but you would have to be very careful in making
sure. The copyright may have been implicitly transferred back to the
author according to a clause in the contract with no action being taken
at the time the corporation dissolved. Furthermore, a company that bought
the assets (possibly for liquidation), may have inadvertantly acquired the
copyrights. I would be rather surprised if very much software has entered
the public domain due to corporate dissolutions. Still, it would not
be surprising if the new copyright holders would be more receptive to
giving up their rights.

>Another factor worthy of note - most Atari products weren't licensed. If
>you look at, say, a Microsoft product, you'll note that you never OWN
>the product. Your purchase is a license to use. If the product were actually
>sold, then you would _own_ the product and the vendor would have no right to
>dicate the terms by which you used it. However, Atari products were sold
>long before this distinction was recognized and thus are not restricted in
>the same way modern products are.

That is interesting. Why is software now licensed? What is the legal
distinction? Does it effect how the copyright applies or only make a
difference in how much control big brother (oops, I meant Microsoft)
has in how we use the software?

>Back in the real world, (the legal world is so enfused with lies as to not
>qualify,) you have a problem of reason versus the law. The law clearly
>supports Derek's position, but the law in my town also states that anyone
>can file a noise complaint at ANY time no matter what the volume level and

Message-ID: <CWILLIAM.92Jul27094205@tigger.cs.colorado.edu>
Source record: 110254

The following items are for sale, they are seperated by category, some
items fitting into more than one category...

-= Atari 8bit hardware =-
Atari 130XE computer in brand-new condition w/PS $90
Atari color monitor (will also work with VCR, nice sharp picture) $75
Atari 800/XL/XE monitor cable to VCR or monitor for clear picture $5
Atari 400/800/810/1050 9VAC power supplies (nice to have a spare) $3
Atari XL/XE 5VDC power supplies (good to have a spare, expensive new) $3
Atari 800/XL/XE SIO cables (connects drives, etc) $2
Atari Edumate light pen for the 8bit $1

-= Generic hardware/modems for any machine =-
Seagate ST157N 45MB SCSI mech (brand-new in sealed box w/1yr warranty) $190
Practical Peripherals 2400 v32/32bis/42/42bis/MNP1-5 w/docs. Great modem
get the error-correction and data-compression that will work on all
modems for a 9600-baud throughput without paying for a 9600 baud... $125
Magnavox AnalogRGB/TTL/Comp video monitor (works with Atari/Amiga/VCR) $125
Composite color video monitors (work as TV/VCR or for older computers) $75
Monitor arm (big arm attaches to desk and supports up to 14" monitor $20
Volksmodem VM520 1200 baud modem w/ST-Talk (telecomm software for ST) $5
Practical Peripherals Mini/Laptop 1200-baud modem $5
Old-fashioned-style Atari joysticks (Apple/C64 also) $5
Fancy combat joystick with suction cups and multiple fire buttons $5

-= Atari SuperSonic ST =-
Atari Mega 2 ST fully-socketed (good for hacker-type like me) $290
Atari 68030 SST board to turn your ST into a *kickass* machine $490
33MHz 68030 chip (barely used) $190
8MB 60ns SIMMs $28 ea.
40MHz 68882 FPU to go with 68030 (never used) $90
** Buy the whole thing already assembled and you have one hell of an SST!
It may be expensive but its fully-loaded with top-of-the-line components
and if you add up the components its quite a good deal. $1190

-= Atari ST Hardware =-
Atari Mega ST 4 with brand-new internal 45MB SCSI drive & TOS1.4 $590
w/o SCSI drive $390
Atari Mega 2 ST fully-socketed (good for hacker-type like me) w/TOS1.4 $290
w/4MB RAM (I have the DRAMS and its already socketed) $340
Atari 1040STE (incredible sound...) upgraded to 4MB w/TOS 1.6 $290
1040ST FM CPU (case in good shape) w/TOS1.4 and supply $145
Spectre GCR w/ROMS, w/Spectre 3.0 update, System 605, Mac manuals $390
Atari SM1224 color monitor good picture, small chip in screen $95
Atari SM124 mono monitor in great shape $75

Magnavox AnalogRGB/TTL/Comp video monitor (works with Atari/Amiga/VCR) $125
Monitor master $15
Monitor master $15
Astra monitor master w/power plugs and power/audio buttons $20
Seagate ST157N 45MB SCSI mech (brand-new in sealed box w/1yr warranty) $190
Atari ST compact enclosure w/PS,fan,card and latest ICD software $125
I can install the Seagate in enclosure, giving you new Atari 45MB $290
EZRam II board w/2MB RAM for 520/1040ST/FM no-solder install $90
SF354 (SS) external drive $50
SF314 (DS) external drive w/brand new mech $90
Syncro Xpress copies 1disk/30secs and all protected disks
(similar to Blitz! but no drive mods required, just plug&go) $30
VideoKey with RF modulator lets Atari run on TV/VCR/Stereo $30
Supra hard drive controller (SCSI->DMA with cables) $20
Volksmodem VM520 1200 baud modem w/ST-Talk (telecomm software for ST) $5
520ST power supply brand-new (5VDC 3A, 12VDC .03A, -12VDC .03A) $10
520ST power supply (5VDC .8A, 12VDC .2A) $5
ST monitor to Video/Audio RCA for VCR/TV/monitor $5
External floppy/HD PS (+5VDC@1A,-5@.1A,12@.3A) w/floppy connector $5
ST drive cable to 34-pin floppy connector (just plug in a mech...) $5
Atari ST Time-Saver clock saver (keyboard chip) for 520/1040ST/FM $5
ST mouse w/pad $20
Drive Master lets you use two external drives $10
ST printer or modem cable $5
520/1040ST fake-leather cover $1

-= Atari ST Software/Books =-
Kings Quest IV w/docs in box $10
Falcon (super F-16 simulator) w/docs in box $10
Populous (great graphical god-type game) $8
Stellar crusade (space adventure) w/docs in box $5
Sinbad &Throne of the Falcon (graphic RPG adventure) w/docs in box $5
Typesetter ST (desktop publishing) w/docs in box $5
LDW Basic (Basic compiler) w/full docs in unopened box $5
Police Quest (famous Sierra adventure) w/docs $5
Beckemeyer Hard Disk Sentry (fix/optimize hard disks) w/docs $5
DeathSword (also called Barbarian) very cool head-chopping game $5
Autoduel (Car Wars) w/docs in box $5
TimeLink (calander/diary/scheduler/database) w/docs in box $5
A Day at the Races (horse betting game) w/docs in box $5
Trump Castle Casino gambling (good graphics) w/docs in box $5
Universal Item Selector 3.0 (a must have) $5
Sundog w/docs (in my opinion, all-time best game for ST) $5
Thunder! spelling checker w/docs $2
Flash 1.6 and Shadow (background downloader) - disk only $2
Turbo ST 1.6 - disk only $2
Atari ST internals (details ports/OS/chips) book $5
"Programming with GFA Basic 3.0" for Atari ST book $2
Compute/START magazine disks free w/any ST purchase FREE
SupraDrive Hard Disk Utilities w/manual FREE

ST Language Disk or 1st Word disk FREE
Atari 1040 ST manual FREE
Atari ST BASIC Sourcebook and Tutorial FREE
Atari ST Logo Sourcebook FREE
Atari 1st Word w/manual FREE

-= Chips and RAMS =-
Phoenix 286 NEAT BIOS ROMS $2
9 64K video RAMS (M37S64) to upgrade EGA card to hi-res $5
18 256Kx9 80ns DRAMS .75 ea.
1MBx8 100ns SIMM (Mac/Atari STE/Amiga) $8
68000-8 new processor with socket (for Atari ST and others) $2
Atari CO25912-20 MMU for Atari ST $5
Atari TOS 1.2 ROMS $5
Atari CO70122 chip $1
20MHz oscillator (DIP style case) $1
Apple Mac Motorola 68851-16 PMMU chip $2
8 256Kx8 SIMMS (Mac/Atari/Amiga) $5 ea.
8 1MBx8 60ns SIMMs (Mac/Atari/Amiga) $30 ea.
33MHz 68030 chip (barely used) $190
40MHz 68882 FPU to go with 68030 (never used) $90

-= Misc. other electronic stuff =-
Sony modern (super-thin) Betamax (copy protection doesnt work in Beta) $75
I will send 20 free blank tapes with the Betamax
My First Sony portable CD player runs off batteries/AC/car with
built-in speaker/headphones/lineout plus no one will steal it! $90
12VDC 2/6 amp car battery charger with nice long cables $5
KORG Concertmate 3500 weighted keys/touch sens/MIDI/manuals $795
Comet pinball machine in very good condition w/manuals,parts,etc $595

-= IBM Hardware =-
Elt 286 20MHz Motherboard- Ami BIOS, 1MB RAM (8MB maximum in DIP/SIP),
NEAT chipset, 80287 FPU installed, LIM EMS4.0/Shadow built-in $125
ATI VGA Wonderboard w/512K&mouse, handles up to 1024x768x256 will work
in 8-bit, but faster in 16-bit, has *both* CGA/EGA/VGA ports $80
IBM AT 200W original (never-used) power supply $20
External 5-1/4" full-height drive enclosure with 200W PS/fan/lights $20
Boca IO/AT 2serial/1parallel will work as COM3/4 w/docs&disk $10
Miniscribe 4020 20MB MFM 5-1/4" full-height hard drive $10
Heavy, sturdy metal PC/XT/AT Tower stand converts desktop to tower $5
Xylex ST506(MFM)->SCSI card (identical to Adaptec 4000) $5
5-1/4" mounting h/w for 3-1/2" HD w/busy light and pretty cover $5
Phoenix 286 NEAT BIOS ROMS $5
9 64K video RAMS (M37S64) to upgrade EGA card to hi-res $5
IBM Game controller w/2 game/joystick ports $2

-= Will consider trades for =-
Ski boots mens size 13 and ladies size 9, HP Deskjet, 1MBx9 SIMMS,
1024x768x32768 VGA monitor, 386 motherboard or basic 386 system,
1.2MB 5-1/4" floppy, IBM adventure/RPG games (even old ones), Roland MT32,

Soundblaster or similar IBM sound board, CD-ROM drive (mech only preferred),
100MB+ IDE/SCSI drive, Simple radio scanner, FPU for 386 system,
Tuner/amplifier which handles both audio/video inputs and has a remote

-= Terms =-
You mail me check/MO or tell me to ship COD ($4 extra). I will also
accept GeNIE Gift of Time (its easy) for items < $50. For shipping,
figure on $5 for a number of reasonably smallish, light items. $10 for
bigger stuff, $15 for monitors and computers. Minimum order of $10.
You can have one of the free items with each purchase. You may email
response to cwilliam@cs.umd.edu or C.WILLIAMS06 on GeNIE or phone me
at 303-665-0614 day/night until midnight CST. Gosh, after looking
this over I have alot more stuff than I thought!

3003. SpartaDOS utilities?

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-27 12:49:00 UTC
From: a644690c@edinboro.edu
Message-ID: <0095E311DDB0FA00.206073BE@edinboro.edu>
Source record: 110250

Hi all,

As you all (should) know, I am trying to put together a SpartaDOS FAQ sheet
as well as an archive of all the various SpartaDOS utilities. If you have
a good collection of SpartaDOS utilities, could you please send me a list of
filenames. (A simple raw directory would suffice. Ie. DIR >>FILES.TXT).
This would be of great help as I try to compile my list of avaiable utils.
(Oh, could you also mention which utils you like best or use most. Note too
that the utilities do not have to be 'SpartaDOS ONLY'; if they are usefull
under SD then I want to include them.)

Thanks a lot.....

-Adam Conover.

>your typical Joe 6 Pack Atari user [...]

>BULL****!!!! You are a complete disgrace to the Atari community. I hope
>you not only get sued by every 8-bit software developer past and present
>but that you lose your net privilidges as well. You're also pretty stupid.
>By blatantly offering your piracy services in public, you're opening yourself
>for all sorts of trouble. Moron.
>
>- Darek

My, you're a BITTER little person, aren't you?

You refuse to explain the whole story, but I gather that you wrote some software (an 8-bit emulator for the ST and/or PC) and apparently it was pirated. Because of that, the entire Atari community is now *nothing* but pirates - "Joe 6 Pack" pirates, even. Fascinating.

Either jettison this emotional baggage you're carrying, or quit reading this group. It'll do wonders for your blood pressure and add years to your life.

3006. AtariWriter Printer Drivers

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-27 15:24:42 UTC
From: gary@mcsiad.UUCP
Message-ID: <323@mcsiad.UUCP>
Source record: 110202

This summer marks over 9 years since I started building the first Printer Driver for the AtariWriter Word Processing Cartridge. In those 9 years, Atari sold over 800,000 original cartridges and God knows how many AtariWriter Plus products. I sold about 10,000 Printer Driver diskettes, originally through the old Atari Program eXchange (APX), then for the last 8 years by mail order only. Several companies started copying my Printer Drivers and I'm sure that thousands of copies have been made by individuals. Still, I'm here to support users of the Atari 8-bit machines who still use the old AtariWriter cartridge.

I still sell Printer Drivers for about 140 different printers, however, I have stopped trying to create new Drivers to accommodate all of the new printers. I still sell them for $10.00 each for a diskette and User's Manual, customized to each printer.

If you are interested, or know someone who is, send check or money order to:

Soap Box Attack, so you can stop reading now. Copyright laws were written at a time where novels like Moby Dick were being written. It was concievable that writting the "Great American Novel" could set you up for life as well as your heirs. There was also a need for trade mark, brand name protection since a company may well be in existance for decades. IMHO: These laws are being wrongly applied to software. If a special case for software is not created, then it should be a case of patent law where it would be valid for 17 years. Patents were originally concieved as an exclusive use for a fixed term in exchange for divulging the technology behind the invention. It gets me PO'ed that software writers that that they deserve a better deal then the invertors of the laser, telephone, powered flight (whoops! inveNtors above), integrated circuit, etc, etc. Take Ben & I as examples from the pharmacuetical field. If we come up with something there is a lag time of at least 7 years before a product can be introduced while testing & FDA clearance is being sought. So you end up with a mere 10 years of an exclusive market. Does that stop development of drugs in the US? I do ack software is being copyrighted & even though it is a mistake to copyright it in the 1st place they are entitled to protection under the law. Just as an example (& I'll ack my figures may be off) Lotus 123 does about $300 million/year in sales. 17 years means a $5.1 billion gross. Software developers are blind if they think any other technical person thinks of them as "Artist" deserving perpetual exclusivity on their work. It's just code! not the freaking Mono Lisa.

Source record: 110156

So in all of this discussion..no one has seem to come up with a
solution. It is apparent that we have a computer that is useless
wtihout software. Point: You can't buy the software!
So, what do we do?
In the very least, the Atari Corp. has an implied warranty with it's
consumers, namely that it's computers would be suitable for the
purposes for which it was advertised..
It is not! Therefore, I suggest the following:

1.) The Atari corp must take the lead in this matter..releasing all
8bit software that is under their control to the public domain, perhaps
establishing a BBS for user access..ideally both the sofware and the
Source Codes..This seems only fair, since 8-bit users have indeed
spent considerable sums which have directly benefited the Atari Corp.

2.) If not, then any person who buys an Atari product is CRAZY !
Sorry to say, but ST users are setting thmselves up for the same fall that we have taken.
There is NO WAY
that I will invest my money in an Atari product until I see some
change in the way this corp treats it's customers. I think that anyone
who feels the same way should let these people know about it.

Why take this crap? We are the customers, so we are right.

What do you say..BOYCOTT ATARI and let them know about it!

Hope this loosens up some of those tight assed execs..

3011. Classic Atari Cartridges

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-27 18:15:44 UTC
From: chase@electron.rutgers.edu
Message-ID: <Jul.27.14.15.43.1992.11884@electron.rutgers.edu>
Source record: 110158

Classic Atari Cartridges for the 400/800/XL/XE computer, v. 1.6

I am trying to compile a list of all cartridges released for the Atari 8-bit computers. I am organizing the list by catalog number as listed on the outside of the cartridge, when available, and by manufacturer. A release date column is included as well.

The release dates are not intended to be very accurate at this point. They are intended only to give an idea of when the cart was released (i.e 1982 release versus 1986 release). They are almost always the copyright date on the cartridge. In fact, I might as well call it that, since there is little else to go on usually.

The list is filling up quite nicely thanks to many contributors. A number of Atari cartridges, especially newer ones, are still undocumented, but I hope to fill in the gaps shortly.

The following questions have come up while working on this list.
* Is the Rev. C BASIC cartridge distinguishable from the Rev. A, i.e is their a different catalog number for it, and what is that number?
* Was their ever a Superman cartridge for the Atari 8bits? I have found a couple of old mail order ads listing it, but I suspect it might be vaporware. The same goes for Star Trux.
* Is there a cartridge CXL4001? (i.e., before BASIC)

I'd would like help completing this list. If you know of any other cartridges issued for the Atari computers, and/or know the catalog numbers or release dates of some of the unknown ones, please send me an email message with details so I can update the list. Thanks.

Kevin Chase <chase@physics.rutgers.edu>

3012. Pirated software

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-27 18:51:18 UTC
From: dunham@devnull.mpd.tandem.com
Message-ID: <2125@devnull.mpd.tandem.com>
Source record: 110159

How's this for an inflammatory post?

I admit to owning several pieces of pirated SW, although none have been acquired recently and none are in current use. I have always treated such acquisitions as shareware: try 'em out to see if they're worthwhile and go buy a real copy if repeated use appears likely. If I don't use them I don't destroy them, I just stash them for posterity. Is this illegal? I'm sure it is, but I fail to see how it runs counter to the author's benefit. I have bought SW because of this that I would not have otherwise, and I have not failed to buy SW that I would have otherwise, so how have I damaged the authors? The goal of all this copyright stuff is to see that an author gets to benefit from the fruits of his efforts, nicht wahr?

By contrast, I must admit that I have a couple of bits on my ST that are shareware and are being used regularly that I have not paid for. My excuse is that they are of some age and it is a bunch of trouble to go find the author so I can pay him. That's not a good excuse and I do intend to make things right. In fact, you may see me post here to see if anyone knows where some of these folks are today. Time to pursue it is the biggest problem.

'Scuse me while I go don my asbestos suit....

3013. Re: Piracy, morals and Microsoft employees

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-27 19:41:09 UTC
From: crow@coos.dartmouth.edu
Message-ID: <1992Jul27.194109.8966@dartvax.dartmouth.edu>
Source record: 110163

In <1992Jul27.171123.24112@news.ysu.edu> xx140@yfn.ysu.edu (Atari SIG Sysops) writes:

>So in all of this discussion..no one has seem to come up with a
>solution. It is apparent that we have a computer that is useless
> wtihout software. Point: You can't buy the software!
>So, what do we do?
>In the very least, the Atari Corp. has an implied warranty with it's
> consumers, namely that it's computers would be suitable for the
>purposes for which it was advertised..
>It is not! Therefore, I suggest the following:

>1.) The Atari corp must take the lead in this matter..releasing all
>8bit software that is under their control to the public domain, perhaps
>establishing a BBS for user access..ideally both the sofware and the
>Source Codes..This seems only fair, since 8-bit users have indeed
>spent considerable sums which have directly benefited the Atari Corp.

If anyone approaches Atari with this argument, please DO NOT ASK FOR
ANYTHING TO BE PUT IN PUBLIC DOMAIN! Atari would be foolish to do so
since it could make implementations on other platforms public domain
as well. (Or at least make it legal for some other company to make the
game without paying royalties to Atari.) We don't want public domain, we
want access to the software. The solution is to have them declare that
they retain all rights, but will allow the software to be distributed
in a shareware-type fashion. They could even ask that a read.me file
accompany all Atari software with an address that $2-$5 in royalties should
be sent to if you use the software. Who knows, they may even collect enough
money to take some interest in the 8-bit community again. (Yes, I know it's
doubtful.)

>2.) If not, then any person who buys an Atari product is CRAZY !
>Sorry to say, but ST users are setting thmselves up for the same
>fall that we have taken. There is NO WAY
>that I will invest my money in an Atari product until I see some
>change in the way this corp treats it's customers. I think that anyone
>who feels the same way should let these people know about it.

>Why take this crap? We are the customers, so we are right.

>What do you say..BOYCOTT ATARI and let them know about it!

We need to make a serious effort to get the software available in one format
or another first. But if Atari doesn't agree to some sort of reasonable
solution, then it's time to start a serious letter writing campaign and
try to get ST users to help us out.

HH> Another unpleasant "feature"
HH> (IMHO) is a leftover from the ATARI 40-column printer days. If you
HH> send
HH> ANY character after a RETURN, the P: handler will pad it out to 40
HH> spaces! Very annoying for a program I was writing... I couldn't get
HH> around it at the OS level.

HH> --Michael

HH> ---
HH> ---------
HH> Michael Hill <>< Isaiah 9:6 | "Outside your door He is waiting,
HH> waiting for
HH> hill@spot.Colorado.EDU | you/ Sooner or later you know He's

Its been awhile, but it is my understanding that ANY of the device drivers built into the Atari OS can be replaced by the user (well, the program used by the user anyhow). The device table is read from the bottom up for the first occurence of the device name and the vector to the handler. To get around the buffer padding for the printer will require you to write your own P: handler and install its vector in the device (handler) table. Since the OS will take the first matching vector it comes to, the replacement P: handler would be used rather than the one built into the OS ROM. A fair example of building your own printer handler is the G: driver published some years ago in ANALOG. (You are right though that the 155<->13 translation happens in the printer adapter hardware and cannot be controlled by the P: handler).

From: Jim_Johnson@abcd.Houghton.MI.US
Message-ID: <Jim_Johnson.05wz@abcd.Houghton.MI.US>
Source record: 110160

I assume you are talking about building a RS-232 serial port and a Centronics compatible parallel port for your 8bit directly from the SIO port. Sorry to say, but you will be major money ahead to buy something like the P:R: Connection. The SIO port doesn't have the correct voltages or data lines to simply assemble a cable with a SIO connector on one end and a RS-232 connector on the other end.

Going from a RS-232 line to a SIO device (as in the ST-Xformer) is another story. It is much easier to drop from RS-232 12volt signals to SIO 5volt signals, AND not too much more than the data lines and software polling signals are needed to send/receive from SIO devices.

You don't have to try to stuff a 1200XL keyboard into an 800XL. The 800XL
OS retains full support for the 1200XL function keys. Just add four push
button switches and wire them into the keyboard decoder chips (see messages
from here about a week ago). You will have full 1200XL functionality
without the limitations.

3019. Re: Pirated software

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-27 21:31:10 UTC
From: Jeff McWilliams <JJMCWILL@MTUS5.BITNET>
Message-ID: <92209.163110JJMCWILL@MTUS5.BITNET>
Source record: 110176

Jerry,

Your "try before you buy" method may seem to be a legitimate reason for obtaining copyrighted software, but unfortunately it's a rule that gets abused I think more often than not. There was a time when a company existed where you could rent Atari software. I think it was based out in California. For a small fee, then would send you the disk and a XEROX of the docs (so that you don't destroy their originals).
My brother did this, and quite cheaply obtained his own pirated copies of 4 or 5 programs. Ideally, I am sure the business was set up so that you could try the software, and then if you really like it, you buy a version for yourself. But since it's so easy to abuse such a practice, it was, from my direct experience anyway.

Further, if you would allow me to push the reality envelope a little wider than usual, who says what the trial time for a piece of software is? One week, two weeks, a month? If you're buying an arcade game, you could very easily solve that game in the alotted trial time, and then you would have no incentive to purchase the program. In such a case, you can't really say the program was bad, because it did provide you the entertainment that the company promised it would provide. But all of a sudden you've found a somewhat legitimate excuse for not buying that program. Or, if everyone "borrowed" the program on a trial basis, a company could go out of business waiting for people to decide whether or not to purchase the thing.

Invoking a "try before you buy" enters you into a horribly grey area, where many things can happen, from honest people actually purchasing the software they like, and discarding the software they don't, to people coming up with reasons to keep the trial program while not purchasing the real product.

Not to flame you of course, just to point out some negative aspects of the theory. It would be great if everyone had a dealer or user group near them, because then the "Try before you buy" rule could be carried out in the store or at a meeting. You go and see the product, maybe play a quick game or look at an application's features quickly, and if you like it, you but it, and if you don't like it, you don't. There would be no piracy involved either way.
Unfortunately, everyone knows dealers aren't to be found, and even user groups are getting scarce.

That's where product reviews come in. It's supposed to be the job of the product reviewer to explain as clearly as possible how the product works, what is good and bad about it, etcetera, so that from that review you can make a purchase decision without having to resort to obtaining a pirated copy simply for trial purposes. Hopefully, within the next several

months, you will see the emergence of Atari Classics, and be able to look forward to well written reviews of software and hardware for your computer.

Jeff McWilliams
jjmcwill@mtus5.cts.mtu.edu

3020. Old Software

Source record: 110167

Tsk, tsk, tsk! Now Michael, you are such a very naughty boy! How many times have Mummy & Daddy told you about that temper of yours? You know, Santa Claus might not come to your house this year if you keep doing that. So run along now & apologize to Uncle Darek. Unle Darek is a very nice man & has given us many fine & wonderful things.

<Aside, to Uncle Darek>. Really, Uncle, it certainly was not very nice of you to label us all pirates. Dear me, Joe 6-Pack. Stupid, moron, & other ravings. I do hope you haven't been skipping your lithium tablets again. You KNOW what happens when you do that, the doctor will have to commence those nasty shock treatments. You don't want THAT again, do you?

So, you two boys shake hands now. There, that's better. Uncle Darek, wipe that foam off your mouth. And Michael, quit sticking out your tongue or it's no Santa for you this year.....

Us Alchemists are getting too old for this. Martha, I thought you told me the children were all grown up! Sheesh. <tee-hee!>

OK, serious now. The experiences- & attitudes- expressed by people such as Jeff McWilliams & Uncle Fester are quite common. Most of us still in this market admit it only furtively. Jeff only expressed sentiments which quite a few 8bitters hold. Myself among them. I, too, passed thru a stage a stage when people handed me copied software like it was no big deal, & I accepted it. I guess it was a period of 8 months, right after I bought my first 800XL. Then I read an editorial on piracy in ANALOG. I changed my ways.

I DESTROYED all the pirated software in my possession.
I went out & BOUGHT as much of the destroyed material as I could find. That was in 1985 or '86, when there was still a viable 8bit market. I replaced about 95% of the destroyed material over the next year or so. Not only did I have the satisfaction of knowing I was supporting the legitimate 8bit market, but it sure was nice to get a *manual* with the software, which the pimple-peppered teenybopper pirates never bothered to reproduce. (In my area most of the pirates turned out to be 13-16 year-olds who swapped software & baseball cards interchangeably.)

About a year ago, in the July/Aug 1991 Current Notes, I raised up the indig-nant hand of an honest user & smote a mighty blow against 8bit piracy by publicly exposing the DataRush operation as the most blatant pirate vendor I had ever seen. Using money that was later repaid to me by Current Notes, I purchased a number of copies of then-current commercial software, & published the list of pirate titles I had obtained. One of the companies whose products were being pirated elected to pursue the DataRush operation & persuaded its owner to adopt a different occupation. I counted a great victory, & waited for the 8bit market to rebound. It didn't.

In all of 1991, there were only 2 new releases of commercial software for the 8bits. They were: Movie Credits by LJK; & ChromaCAD by Marv Seaman. With some difficulty I expedited arrangements to get reviews of those 2 programs published in CN.

But that was last year. Now it's 1992, & everything is different.

In 1991, Atari still officially supported the 8bit community. But beginning in 1992, Atari has kicked out butts out in the cold.
ICD has abandoned us.
EXPLORER, whose 8bit coverage was never more than superficial, has undergone yet another shakeup (the phrase "Jack attack" comes to mind).
PSAN folded.

And I must confess I have had second thoughts about the DataRush affair. He was so darn brazen about it, it was like he wore a neon sign that said, "I'm a pirate & proud of it!" I did the right thing then, & given the same circumstances I would do it again today.

But if I encountered a pirate who had the good sense to stay in his dark slime pit where he belongs, would I still go after him, skewer the vermin on the end of my pen, & expose the monster in the pages of some magazine? I honestly don't know, & I hope the situation never arises. The very fact that I now vacillate on this question troubles me deeply.

In this, Year One of our excommunication from the Tramiel Entente, not one single new piece of commercial 8bit software has appeared. That also troubles me greatly.

In the past couple issues of this Digest several people have expressed quasi-legal opinions on the legality of copying abandoned software. Judging by the contradictory nature of those opinions, the legal issues are just as murky as the moral ones.

Yet, as our community contines to sputter on despite all the currents that are flowing against us, this is an issue which more than any other, tears at the conscience & knaws upon the inner fabric of moral sensibility. Most of us out here are very decent people. We are not pirates or criminals. We want to do what is right.

But we also want to SURVIVE, to maintain our faith in the brotherhood & companionship of other 8bit users like ourselves. We have all paid our dues, & we have a RIGHT to this existence!

Perhaps if as much energy were expended upon serious professional legal research & open discussion of the moral issues involved as was spent upon the recent silly flame war, we might actually accomplish something useful for ourselves.

- BEN POEHLAND
The Alchemist

3022. PSAN

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-28 00:05:03 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9207280005.AA22210@smithkline.com>
Source record: 110168

The word I have is that PSAN folded last year.
The last issue of PSAN I'm aware of came out around March 1991. The cover was a riot. It featured Saddam Hussein wearing a duncecap, & camels with bullseyes painted on their humps in the background.
Sometime in the fall of 1991 I sent Jim Chapman a postcard inquiring about PSAN & requesting a sample issue. I never received a response.
Several sources mentioned it was a severe case of burnout.
A few months ago I heard a rumor PSAN was going to start up again this Fall.
We'll see.....

>the moral ones.
I'll second that. This isn't really a clear cut issue. Sure we'd
like to support the authors of 8bit software, but the reality is
that there aren't any authors left, and the old software can be
difficult to find. In the past, the software companies and authors
were actually hurt by 8bit piracy, but now that point is moot.
The only people it still hurts are those retailers that still
carry the stuff.

Source record: 110171

Okay. So we all agree that there's a problem, but nobody seems to have a solution. We probably can't get any help from Atari. ("probably", hell I'd say "definitely not".) So the only people that can help us is "us".

Sounds stupid doesn't it? But that's the truth. And right now distribution of illegal copies of software is the solution. But we agree that piracy hurts. As Todd Greenfield said, "...that point is moot."

I can't think of a damn thing that wouldn't require an act of Congress to pass legislation making 8bit Atari users exceptions to copyright law. It ain't gonna happen folks.

However, I do have a question that may provide some answers if the right people read this and know from their experience what I am talking about:

Atari 8bits are orphans. TI-99 is an orphan platform also. Just what happened to users of TI-99 computers? Did the software for it go into public domain or was it relegated to the oblivion that we now face? If the TI-99 users were successful in reaching a solution to the problem, what was it? (the solution) I don't know because I don't know anyone that owned on of them things. Are there any other orphan computers out there that managed to meet this problem and defeat it?

The answer to the question of other orphans may not be what we want to hear. It's probably the same answer that we all know in our hearts. We're in the dumper.

But what the heck! We could make history repeat itself by doing something that worked for Star Trek fans a quarter century ago. (yes, THAT LONG.) Maybe we need to organize a huge letter writing campaign to not only Atari but also computer related publications and corporations that made products for the Atari. I know that there are lots of us Atari 8-bit users just as there was lots of Star Trek fans that made NBC change its mind and give Star Trek another season. We could have another " "season" also. Do we believe in the machine enough to launch a truly dedicated campaign that could only be effective if enough of us actually followed through with the idea and not just paying lip service to it? I know in the past, most Atari users counted on "the other guy" to get things done for him. We couldn't afford an atitude like that if we really want things to happen for us. If there could be a way to set a near-future date for the campaign to start, we could prepare for it by spreading the word to make sure that as many users know about it and can participate. I seem to remember something about another "Atari Revolution" that was a dismal failure though. (but Atari itself screwed that one, admittedly.) What I am trying to say, is that there is no way for our "voice" to be heard if it's just a puny little 'squeek' rather

than a massive 'roar'. We have lain down in submission in the past and let the times roll over us. Will that happen again if we try to launch a campaign that could help us rise up out of the dust and have another "Golden Age of Atari"?

It's either boot-strap ourselves up, or continue to bitch and moan and pass pirated software.

It's our choice. Nobody else is going to make it happen for us.

Since I can only make suggestions and pose questions, I would like someone else to help. Some of you seasoned programmers and others with connections to the right publications and people can help organise. I have never organised anything bigger than my desktop, so I need help.
I
Is this the way we should go, or does anyone have a better idea?
(although this was really not my idea - I just followed up on it)

C'mon! Let those MicroSoft microcephalics go rave in a dark corner somewhere and let's do something! Anything!

I am totally serious!
Anyone else game?

It amy be a bit different, but the SIO2PC hardware device does allow 2-way communication with a RS-232 port. If you're building something that deals with RS-232 and SIO, I suggest you look at the hardware specifications for SIO2PC available at the archive site.

3027. Touch Tablet: need pinouts!

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-28 04:27:20 UTC
From: nlin@alliant.backbone.uoknor.edu
Message-ID: <1992Jul28.042720.8963@constellation.ecn.uoknor.edu>
Source record: 110172

After hitting a garage sale and misc.forsale, I have assembled myself a(nother) small working Atari system; Atari 400 + cassette drive + miscellaneous hardware. Among this miscellaneous hardware is an Atari Touch Tablet. I'd like to try to use it with my "AtariArtist" cartridge, but unfortunately the connector (that goes into the joystick port) for the touch tablet has been ripped apart, leaving only wires. Reassembling the connector would be easy if I knew which wires go to which pins.

So does anyone know which wires (i.e. purple goes to pin 5, white goes to pin 9, etc.) go to which pins on the Atari Touch Tablet? Any help would be greatly appreciated!

Thanks,

Norman Lin

3028. SIO2PC/UltraSpeed+ OS problem

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-28 05:26:44 UTC
From: jewison@aurora.physics.utoronto.ca
Message-ID: <Bs334K.3F7@helios.physics.utoronto.ca>
Source record: 110174

OK, guys. I've got a problem for you and the answer is not intuitively obvious to me.

I have an 800XL to which I have added a TransKey and the UltraSpeed+ OS from CSS. I also have built an SIO2PC interface, which I've just upgraded to version 3.03. Here's the problem:

Under the previous version of the SIO2PC software I was running, 2.12, I had no problems with my hardware configuration. With version 3.03, I cannot boot from the SIO2PC while the XL is running in US+ mode. My monitor speaker spits out that horrible raspberry sound you get during a device timeout and I end up in the US+ self-test mode, indicating that the computer doesn't believe there's a drive attached. However, if I flip the switch on the OS chip so that I'm running either the standard XL/XE operating system or else the XL-Fix OS (basically a 400/800 OS) then the SIO2PC will boot just fine. It times out only in US+ mode which is unfortunate since I want to use the built-in ramdisk handlers in the US+.

I haven't yet pursued this with either Bob Puff or Nick Kennedy, but I was wondering if anyone would have any insights into this dilemma. My guess is that some change in the SIO2PC software from v2.12 to v3.03 is now adversely interacting with some nuance of the US+ OS. But what?

Feel free to post if you like, but I've directed followups to me directly; I'll summarize the results in two weeks when I return from vacation.

>Do you HAVE DOS 2.0D? I've never heard of anyone who had seen it. Maybe
>you have an 815 Drive to go with it?

Well, no. I did let a 815 drive slip through my fingers about 10
years ago...

But I DO have the Atari 2.0 double density DOS. It's really the
same as 2.0S except that it uses DD sectors, so if you were looking
at a directory, the sector counts would look funny.

I forgot where I got it... Probably another user in Sacramento,
when I was more active in the local user's group.

I remember reading somewhere that they were written by OSS (under contract
for Atari) using an assembler on an Apple II. This may go for DOS 1.0, as
well. (BTW: Where could I get a copy of DOS 1?)

It's my understanding a lot of the software developed by Atari was done on mainframes (DEC PDP-11's?) using terminals. I've heard Wilkinson did DOS XE on his trusty 1200XL & I imagine a lot of stuff developed after the creation of tools like the Assembler/Editor cartridge was done on the 8-bit. Heck, I even have cross assembler for my clone. it'll do everything from RCA 1802 to Rockwell 65C02. I don't use it, but I can understand why other people would. Boot up your favorite WP to edit your code with 80 column full screen scrolling then pop into the command line to generate the .OBJ file. If you have a local library that has either Dr. Dobb's Journal or Steve Cicara <sp?> Circuit Cellar, check them out. They both have cross development packages advertised that'll give you an idea of what's available for different target processors.

Message-ID: <Jim_Johnson.05xt@abcd.Houghton.MI.US>
Source record: 110183

The reason I sold all my Atari 8bit stuff almost a year ago was that the excitement was gone. I had moved a few hundred miles from an active user group (SPACE - St. Paul - and I've seen the trails of several of my co-members floating through here). There apparently was NO one locally involved with the 8bits (now there appears to be a couple Michigan Tech students). I could not obtain any decent new software (I'm not into games which is what most of the privately developed stuff appeared to be). And finally, it was a major pain continually transfering data and text files between MS-DOS and SpartaDOS.
So I sold my stuff and bought a portable DOS machine which I use in my consulting business. In some ways I have more power, but in many ways I have much less.

At any rate, the 8bit is now an orphan. Rather than pirate the old software, what I would suggest is group(s) approach copyright holders and see if they will sell their rights to the group - cheap. The publishers obviously aren't getting anything in sales - so maybe they will let it go. In some cases it will probably be tough trying to find out who owns the copyrights. There's my
two cents (BTW, my DOS machine can produce a cent symbol - but it turns out to be the Atari EOL character - hardly useful here, right?)

>I need a new one!! Where? How much?

The power supply on my Indus GT was frotzed several years back. I replaced it with a 12VDC unit from Radio Shaft. As I recall, the max current rating on the RS supply was a bit lower than that on the original Indus supply, but it's been working fine for years now so I don't hesitate to recommend it. I don't have the exact catalog number handy (I can go home and look if you like), but it's the black plastic 12VDC power supply (maybe 1A current). They also sell a couple others in gray metal cases, but these a) cost a heck of a lot more, and b) have more current than you need, and thus are overkill.

You have Radio Shaft stores in Israel, right? ;-)

I bought a used Indus w/o the power supply, and I just bought
an unregulated 12v supply for about $5 (can't remember where).
I looked inside the drive - there is a voltage regulator and a
big capacitor, so you don't need to be as picky with the power
supply as you would for an 800xl for example. All you really
need is a transformer and rectifer. Don't know how much current
it draws.

They were developed on PDP-11's, as you can tell from the Atari
Hardware manual, which gives PDP-11 command sequences to load the test
monitor from an Atari development machine. I was pretty jealous when I
read that part in the manual!

Bugs are present in almost all code -- witness the recent collapse of
a major AT&T phone routing network due to ``a few lines of code''.

I still write Atari assembler on a workstation. A cross-assembler in a
UNIX environment is a very nice thing -- I use a small one which I've
written in C and you can imagine how much easier it is
to go through the edit-assemble-edit cycle. I can download the binary
straight to the Atari via RS-232 over a 2400b modem (or just right off
the port on the workstation, if I bring in an xl machine on the
weekend or at night). This is all very much simpler for me than the
old Atari Macro Assembler or (even worse) the Assembler/editor cartridge.
But then I have a pretty low-tech system; no hard drive and none of my
machines have more than 48K. My main use for these beautifully
engineered machines is for incorporation in to electronic projects
which require a brain, and some small ``home computation'' tasks.

Message-ID: <1992Jul28.193007.3133@news.ysu.edu>
Source record: 110188

Atari corp has had long enough already.. Let's not play nice guy
with hat in hand approaching them for a "favor".
Who cares idf we piss them off? What are they gonna do..drop 8-bit
supprort? Ha!
I'm tellin' you..I will not buy any of their products, present or
future, no matter how glitzy..until they properly address the customers
they have abandoned!
As a matter of fact..the TV station I work for was looking for a
graphics machine, and I am in charge of selecting the system...
The ST would do a better job at a cheaper price..do you think I
stuck my neck out and supported the Atari product?
Hell no...get a PC I told em!
They bought 6 (six) of the darn things!

Yes Atari..I am your worst advertiser..what do you think of that?
So if there are others of you out there who feel the same way, let's
pull it together and tell these guys to get a GRIP , or we will trash
their reputation worldwide...

That is the only way I kow to deal with a large, unresponsive company.

3043. SOFTWARE AND HARDWARE FOR SALE!!!

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-28 22:32:49 UTC
From: lenn@mentor.cc.purdue.edu
Message-ID: <55352@mentor.cc.purdue.edu>
Source record: 110189

I have the following hardware for Sale:
65XE Brand New - $60

2 (1050's) One newer and quieter $45 One older but works fine $
w/Dos 2.5 or Mydos your choice

Xetec Grafix Printer Interface $15

Books: Mapping the Atari (w XL/XE maps) $7
Computes Atari Graphics $6
Computes Second and Third Books of Atari $5 each
Analog Compendium $5 (lots of type in programs)
Creative Atari $5

I have the following program disks for sale:

Kampffgruppe: $13

Alternate Reality: Dungeon - $12

Music Const. Set - $8.00

Pinball Const. Set - $8.00

Summer Games - $5.00

Zaxxon - $5.00 (800 only, FIX-XL, translator don't
work!!!!!!!) (no docs)

Suspended - $3.00 (Original, lost docs)

Mail Order Monsters - $7.00

Super Huey - $7.00

Page Designer -$8.00

Dropzone - $2.00

Deep Blue C w/mathlib - $12.00

All items have docs unless otherwise mentioned.

Buyer pays shipping on all items.

JODY LENN
lenn@mentor.cc.purdue.edu

3044. SOFTWARE AND HARDWARE FOR SALE!!! (older 1050 price)

3045. A new perspective on 8bit piracy.

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-28 23:08:28 UTC
From: a644690c@edinboro.edu
Message-ID: <0095E43191CF4C60.20C00892@edinboro.edu>
Source record: 110191

Well, with such an interesting thread going on, I can't resist throwing
in my $.02 as well.

My question is: Why do us Atari 8-bitters really need any commercial
support? Software is not written by companies but by people. If people
(Atari owners) want to write quality software and give it away, what is the
difference? It is not hard to notice that the PD/Shareware of the past
5 years better than most of the commercial stuff produced in the first 7.
Granted, very few individuals have the time to sit and write an 'Alternate
Reality' in there spare time, but I don't think that it is fair to blame
software companies for not supporting 8bit stuff. If a company has talented
programmers they are going to program for the platform that will produce
the greatest cash flow. Even with the A.C. write in campaign, there were still
less than 600 replies (to my knowledge). If you are too lazy to fill out a
card, what are the chances you will seek out software to spend money on.
An apparent user base of less than 1000 people is not very enticing to existing
software companies.

So who is left? Us! The Users! Some of us have more experience with our
Atari's than ANY company could possibly have with their IBM's. I consider
myself a fair programmer and if I _need_ a nonexistent application, I'll
try my best to write it myself. The time issue is a consideration here
again but with a twist; If you own an Atari 8bit machine you obviously
enjoy it. Spend a little time with your machine.... Learn it! I feel
that the Atari 8bit is a great hobbyist machine. (Just like an old car...
A lot of work but well worth the rewards.)

Obviously, everyone is not going to know how to write every little application
they want. This is why we need a Forum; a means to help ourselves.
Something like Atari Classics that would allow easy access to all the latest
info in the Atari 8bit world. A place that people could exchange ideas
and knowledge. Knowledge is Power. Don't abandon your machine 'Just because
a developer did'.

This brings me to my real point (Yes there is one here somewhere!). There
is no point in reinventing the wheel. If a software package exists but has
been unavailable for sale, is it really piracy? Legal aspects aside, who are
you hurting. If the manufacturer has no copies (or is out of business), and
stores have no copies, you are really not helping the market by simply buying
an original from a friend. I not condoning blatant copying however! I think
It really comes down to a moral issue.

We Atari users should almost feel proud! Think about it. We are the First
home computer owners in history to undergo this kind of dilemma. (I believe
the Atari 8bit line is the largest home computer series to actually be declared
obsolete by the manufacturer). We are treading on new ground. Just as the

Atari 400/800 computers were the most innovative of their time..... We, now again, must set a standard for innovation by answering.... Is it Piracy????

-Adam Conover.

Another program that can print out user-defined character sets is Daisy Dot III. What's more is since the 8x8 is converted to DDIII, you can edit the DDIII and make it look better for print out. The only things I see wrong with it is I THINK that DDIII's font utilities (the thing that changes chsets to DDIIIs) does them proportionally, which aint good for program listings. I think some helpful features needed in DDIII are:

1) inverse (simply print out 255 minus whatever bytes was GOING to be printed)
2) proportional off (makes all the characters have the same lengths)
3) disk swaps (lets you swap disks if a file (ie-font) isn't found... it'd be VERY helpful because for some reason DDIII hates my drive 2)

But I've already mentioned this to Roy...as well as to David Richardson, who Roy thinks knows more about DDIII than he does!

By now someone will have answered this, but in case they haven't...
All the complex tools in the world have been built the same way, that is by preceeding generations of simpler tools. The Atari OS, et al, were built by a 6502 cross assembler. That is to say, another computer (in this case a mainframe (archaic by now)) ran an assember that generated machine language code for a different processor (in this case a 6502). Mind you, this is more complicated than writing ML code programs for the Atari, because everyone who writes for the Atari uses routines already written in the OS.

If you think about it, this is the way all the game cartridges for the Atari Lynx, Nintendo, Sega, etc. are built. After all, none of them come with program development capabilities.

I have heard of many cross assemblers for MS-DOS machines to program nearly every commonly used processor ever produced (including mainframes).

> -Itay

The operating system was cross-compiled from a mainframe (can't remember which one, and I haven't been able to find my ATARI Technical Reference Manual in about a year! :^( ). I don't know about BASIC and A/E, but I'd hate to think they were (as a nasty rumor states) written on a Crapple II! <shudder> ;^)

As for why the bugs were there, I'd guess that they weren't field-tested for months on end before release, which is what it usually takes for a large number of bugs to appear.

I have some Antic disks that contain the paint program "RAMBRANT",
as well as some utilities and the SOLID OBJECT MODULE for Rambrant.
The disks are numbered AP0157a, AP0182, and AP0157b..
Can anyone tell me if the source code to these programs ever
appeared in print (Antic magazine)..and if so, in what issue?
Better yet, is the author out there listening somewhere?
I am trying to get this thing to work on my Hard drive..I would like
to change the default drive # for disk access..and maybe a few other
things that will allow it to search subdirectories and exit to DOS.
Thanks

Adam,

I follow your point about buyig an original from a friend, but I don't condone cpying commercial programs, even if the company "isn't around anymore." If the company had folded, the softwar reverts back to the author. A lot of comapnies that aren't in the Atari market anymore are still around. The best thing, would be to get the company to release the old commercial game into the public domain. If a company isn't around (ie alive), we should tr to get ahold of the author, andsee if he/she will release the program into the PD. Who knows who wrote Paperclip, for example? Wouldn't it be nice to get software out into the public domain, and maybe if we get lucky, source code could come with it, for someone like Bob Puff to make an update.

That's the solution, not piracy.

Pattie Rayl (Atari Interface)

3062. Ali Baba++

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-29 17:52:44 UTC
From: tmkk@uiuc.edu
Message-ID: <Bs5wBx.7yn@news.cso.uiuc.edu>
Source record: 110109

[This is a re-cross-post of a pair of notes note originally posted in comp.sys.ibm.pc.games (for reasons that will shortly become obvious). It is being reposted here because Ali Baba was originally an Atari 8-bit game, and thus there may be more people in this group who are familiar with the game and interested in discussing this topic, especiall;y those who, like me, have an Atari 8-bit AND an IBM clone. Those who've alredy seen this post in c.s.i.p.g will want to hit 'n' now; there's nothing new here.]

Speaking of Stuart Smith adventures...

How would you (all) feel about an MSDOS version of Ali Baba or Heracles? How about a version which allowed multiple machines to participate in the game? But wait, there's more! What if this hypothetical game used either serial ports, network connections, or combinations of both, to link the machines together? Suppose the number of machines which could play were limited only by the number of available ports and/or the number of available playable characters? NOW how much would you pay? Is this beginning to sound like a Ginsu ad? ;-)

No, an exact clone of Ali Baba/Heracles is not politically correct, but a new game, inspired by AB/RoH, and incorporating the above features (and more), would certainly be doable from a legal standpoint. But would it be worthwhile (i.e. would there be a market for it)? Would anyone want to play it? Would anyone want to BUY it? Could the concept be sold to a commercial sofware producer, a modern day Quality Software?

This whole concept arises from the question "what do I do now that I've rescued the Princess unaided without attacking a single living thing and gotten the congratulatory message from Stuart Smith?"

The main reason for the multimachine capability is so that people separated by some distance can still play "together," whether that distance be across the office on a Novell LAN (SHHH!! Don't tell the boss! ;-) or across the country via Compu$erve's MTM Gaming facility (for example) or even around the world via the Internet. Or perhaps a multiline BBS could connect two callers together for a game. The flexibility of allowing multiple machines via multiple connection media would be a first in IBM PC gaming history, as far as I know. Some of Dan Bunten's games promise to allow connection via modem or network, but at present they only do modem (as evidenced by the recent Global Conquest, which I purchased for a friend; it needs some sort of driver before it will connect via a network, and the driver isn't available yet according to the docs). Of course, you could also simply play on one machine and pass around the joystick(s), just like the old days. ;-)

As for the game itself, I'd be interested to know how folks think an Ali Baba type game could be expanded to become more enjoyable, given the above sort of connectivity capability. What sorts of things would you add? Suppose you could find magic potions which, if swallowed, can increase your strength or make you run faster or heal your wounds (or maybe poison you!) How about the option to play either cooperatively OR competitvely? Perhaps the game would randomly select a task to be accomplished by each group, and the first group to complete their task would win? Perhaps the tasks would be interrelated such that when one team advances the other is retarded, sort of like a tug of war? Or each team could purposely set up obstacles which would hinder the progress of the other team?

I'm interested in a sort of brainstorming session, to see what sorts of interesting things people come up with. Who knows, I might even be inspired and implement the sucker. ;-)

So, let's hear it from all you Ali Baba/Heracles/Stuart Smith fans out there!

Atari Arcade Game Artwork for sale
Hi,
My brother-in-law worked at Atari for a time and got a piece of artwork
from one of their pinball/arcade games for me. I have no room to hang it
anymore but it would look great in a game room, den, or study. It is a
painting on reflective glass with bright colors of blues, yellows, oranges
etc. of a man and woman on a futuristic motorcycle with the wording
"Spaceriders" across the top. It is almost Peter Maxish. Dimensions
are 28"w x 24" h. It would look great in a kids room too. Asking $30.
Thanks,
Debby
```

3065. Re: Modifying NES lightgun for Atari 2600/7800 - need help

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-29 21:00:15 UTC
From: hgm@ncsu.edu
Message-ID: <hgm.712443615@fbi.cc.ncsu.edu>
Source record: 110114
Cross-posted to: rec.games.video,comp.sys.atari.8bit,comp.sys.atari.st

I came into this thread while it was winding down......

I've just run across a game that I've never heard of for the 2600 --
Sentinel (copywrite 1990!). Bought it, and found that it requires the
2600/7800 light gun.

I have a NES light gun that's hackable -- I don't own a NES anymore. Anyone
have a 2600/7800 light gun, and want to clue us all in on the details? I'm
not going to run out and buy a light gun to play this one game.

>***

I've had a subscription to PSAN for about two years and the last issue of Puget Sound Atari News I received was May 1991. About that time it did indeed stop publication. However I have recently received two issues of Pacific Side Atari News -- PSAN. Apparently PSAN has gone to press again with a slightly different name and a new coordinator since March, although the first issue I received was April 1992 (and it is numbered #1, but there was a reference in a "Letter to the Editor" about some March 1992 issue).

The only contacts listed in the masthead are for advertising, but the Coordinator/Editor (still listed as a member of the "Puget Sound Atari News Staff") is John Strand. His number is listed as (206) 459-4156. He can also be contacted via GEnie as J.STRAND1.

Some notes about the re-emergence of PSAN. It doesn't have the "gloss" of the earlier PSAN (one-color paper cover instead of two-color glossy, for example). The new "magazine" is also noticeably smaller. There are only 3 "Feature" articles in April/May 1992 instead of 10 in the May 1991 (and the June 1992 is about the same), but I'm hoping that this lack of meat is do to its hiatus and that, given time, it will return to a status near it's earlier production. To its credit, however, the first new issue did contain a (1st of 2 part) feature on how to perform a do-it-yourself SIMM memory upgrade for the ST. So there is meat, just not much of it.

Oh, did I mention that there is very little 8-Bit material -- one review out of seven in the April/May 1992 issue (about European 8-Bit games on cassette). For 8-Bit support, you'll find the new magazine disappointing and not worth the $2.50 cover price, but this may

change. I hope so.

The past issues of PSAN that I have I still find to be good references, much like Current Notes (and I certainly didn't mind all the little projects for those of us who like to take things apart and burn fingers with soldering irons :-), and I really hope that the new PSAN becomes a good reference, also. But I doubt that it will reach a status along the lines of AIM or Current Notes; it is really more of a User Group Magazine again.

Hope this helps everyone who was interested in PSAN.

3067. Fax/modems

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-29 21:38:38 UTC
From: potter@sunny0.dab.ge.com
Message-ID: <1992Jul29.213838.8105@ge-dab.GE.COM>
Source record: 110115

Well I've posted some inquiries to GEnie and CompuServe with some scattered responses, so I'll try here:

Would many of you loyal Atari 8-bit users here want to be able to send/receive faxes from your 8-bit? I've collected some info about the subject, and talked to a few technical guys, and it appears to be possible to interface one of the new fax/modems to the 8-bit (using an 850, P:R:Connection, Black Box, MIO, etc.). You would of course have to obtain a fax/modem (I've seen them as low as $75 recently).

Writing the software and doing the testing is a lengthy effort, so I don't want to consider it without some positive feedback on the subject. I would propose creating the fax offline, with (among other things) an editor, maybe using Daisy Dot III to format nicely, and possibly importing images (graphics 8, 9, or 15, or scanned images in TIFF). The send program would read your created fax from disk, and send it out to a fax or fax/modem. The receive program would most likely go directly to disk, allowing you to view the fax offline, or maybe print it on your dot matrix printer offline. Those of you familiar with my APACVIEW and other graphics programs will realize how slow the old 6502 is at interpreting GIF images, so expect similar speed here (1-3 minutes to display a reduced resolution image).

I don't expect to get to a project like this right away, but I thought this might spawn some worthwhile discussion...

Does anyone know what could be wrong with my 1200xl?? Here are a few
things it's been doing lately, even though I haven't been loading up
anything special or spilling stuff into it... :)

Freezing- it froze in BobTerm. Not even [RESET] got me out
DOSing- I was in DDIII's Font Editor, but I left the house for a while
and came back. For some reason when I hit [-] to change chars.
(first button I pressed when I got back) it typed it out
onto the screen... a few seconds later it attempted to
go to dos...
more key freezes

could it be the keyboard/chips?
thanx

Source record: 110118

HEY ALL! I'm working on a program that allows you to edit 8 x 8 x 256 characters! Yes! 8 x 8 x 256. Just like normal character sets, but in 256 colors! Of course you loose a LOT of characters per set (1024 bytes), but you have unlimited characters avaliable to place onto the screen. The program is written in TurboBASIC XL (of COURSE...) and so fa all I've got it to do is edit one character and change it into "TEXT"able characters. (Say you have an 8 x 8 block in GR.9/GR.10/GR.11/APAC mode- it would take up 4 x 8 bytes, or 4 normal character-set characters. If you were to place a character onto the screen, you'd do something like this:
COLOR 1:POKE 87,8 (this would probably be set all the time)
POKE 756,CHC:TEXT X,Y,"ABCD" (CHC is the character set base..)
POKE 756,CHL:TEXT X,Y+96,"ABCD" (CHL is the chbase + 512 (or 1024), and contains the luminence data... CHC cont-
aining the color data)

As soon as I get the editor done, I'll upload it to the archive and commense work on a Galaga clone!!! :) (my FAVORITE game of all time!)

Hopefully TBXL can keep up.. it having to TEXT onto the screen twice for every enemy. (8x8x256 looks mighty nice!!)

Any comments or ideas are GREATLY appreciated.
Bill

Subject: Questions about XE etc.

2 years ago I bought an Atari XE Game System from Toys R Us at a clearance pric
e of $80. I bought it to replace my 400 which had died earlier. The other day
I noticed that the XE is still at the same store at the same clearance price.
Is there anyplace else that actually sells new Atari XE's besides there? A fr
iend of mine gave me 2 old, big, slow Atari 810 floppy drives, along with a few
shoeboxes full of disks, and some other junque.

I can't find any "new" software for the XE at the store anymore. When was the
last year any cartridge and disk games <software> was manufactured for the 8-bi
t Ataris? <--sp? Most of the stuff I have is early 80's, and is rather bad fr
om the graphics point of view. Is there any other game for which the light gun
is good for besides Bug Hunt?

Last year I saw a 1200 baud Atari Modem beand new at a ham feat for $20. I sho
uld have bought it. It had an RS-232 port and the IO port for the Atari. What
is the name of this modem and is there anyone selling it that cheap new anymor
e?

I had a voice synthisizer program called S.A.M., but it no longer works. Is th
ere anyplace where I can get another copy?

Also, the cable connecting the keyboard to the computer has a short in it. Any
one have a new keyboard cheap?

Bottom line is that I am looking for:
1. "New" software
2. The modem which I described
3. A better disk drive
4. New keyboard
5. S.A.M. replacement

I am glad to see that a lot of people besides myself still own and use 8-bit At
ari computers ! :-)

Please post or email me if you can help answer my questions.

Thanx much!
```

Well, I was going to reply somewhere else, but since you need the same info:
One of the best/first Atari only stores is;
B&C ComputerVisions
2730 Scott Boulevard
Santa Clara, CA 95050
(408)986-9960
They do everything from 8-bit to ST, repair, parts, etc. They still have a good selection of just about everything ever made by Atari. Prices run from $8 to about $25 for new software. They have packages of 800 replacement boards for about $30 & reconditioned 800's for $59 with Star Raiders. Ask for their catalogue, you won't be dissapointed.
American Techna-Vision
15338 Inverness St
San Leandro, CA 94579
1-(800)551-9995 or (510)352-3787
They offer just about the same service as B&C, but parts run a little cheaper For instance, they sell a complete 800 board kit for $28.50! In other words, if you have an 800 with everything but the keyboard & case fried, you can get it running again for less then $30. They also have the Newell 1 meg upgrades & drive parts.
San Jose Computer
Alma Ct (I forgot the sweet number)
San Jose, CA
They have a lot of stuff, you can (408) 555-1212 for the number if you have to. I sorta like these guys: When I was looking for a 1772 controller for my xf551 they offered to pull one out of an old drive for me at a couple of bucks.
There's obviously a lot more stores that handle Atari, sorry for the omissions. If you can really wait, don't mind spending a fortune on LD, there's also Compucat. It's the first BBS/Store I ever heard of & they've seperated me from major amounts of money. I believe Atari has cut them off as a regular supplier, but they still have some of the best connections around. May not be the best price since they have to go through a distibuter, but their prices are cost +10% (408)353-4669

Well, one of us is going to have to take his pad apart <g>. Since I don't want it to be me, what I'd suggest is look & the IC's, they're just vanilla stuff like 4049's. Use a VOM to see which lines go to the chip 5V & GND pins. Next look at which lines go to the buttons these will hook up to the stick left & stick right of the joystick port (I think). That just leaves the two lines that go to the paddle inputs. You stand a 50:50 chance of getting it right the 1st time.
If you need the pin outs for the joystick port, let me know.

(Cross posted to .st, maybe someone remembers)

I saw this at B&C Computervisions in Santa Clara, an Atari 1029
printer. It's a dot matrix printer, it looks like a C. Itoh
Prowriter (?) clone.

Does anyone know anything about this printer?

As I recall, Atari never offered the 1029 in the US, I never saw it
in any literature, or saw it at Federated.

Was this an unreleased prototype, or a printer for the European
market?

The 8 bit printers that I know that were released were the;
820 40 column dot matrix
822 40 column thermal, with plotting
825 80 column parallel
1020 color plotter
1025 80 column SIO
XDM121 daisy wheel

You make an interesting point about the actual ownership of software. I have always been under the impression that work done for hire or contract becomes the legal property of the contractor or company involved. Similar to the early Atari days where Programmers were not even allowed to include their names in there works. If the law does indeed state that the copyright falls back to the programmer if a company collapses, then my opinion certainly changes in that respect. Software Piracy IS theft, I admit... and we, as responsible Atari owners, should make every effort to own 'legal' copies of all our software. But... at what expense? How much time and money would have to be spent to reach the proper individuals? And how many of those people have already relinquished there copyright? I have seen many old games on legitimate BBSs where the author evidently gave up the copyright. Who do we contact to find out if these copyrights are still valid? Then there is a question about companies that are still around that no longer support the 8bit stuff (ICD for example): What are we supposed to do when a company simply just sits on a copyright? (IMHO- ICD made some of the finest stuff available!)

[Just A thought: ICD wants to sell the rights to a lot of there 8bit stuff. No one (or company) wants to invest in an 'obsolete' platform. Would it be possible for 'the 8bit community' to purchase the rights to this Software?? We could take up some sort of collection, buy the rights, and release it into PD. This approach could work with a lot of old software. If enough money can not be raised by a group, then that should just show the company that their product is indeed 'obsolete' and they should take what they get. Anyway, Is this a real solution???]

Granted, getting all the great old titles released into the Public Domain would be fantastic, but how realistic is that? I doubt many companies would be willing to simply 'Give up' there rights to a package. And, as I said, tracking down those old authors may be an impossibility. Legality is NOT morality... they rarely mesh. These kind of decisions must ultimately rest with the individual, and we must just use some common sense.

-Adam Conover.

3082. Atari questions

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-30 14:46:00 UTC
From: DUNHAM_JERRY@TANDEM.COM
Message-ID: <199207300750.AA21305@comm.Tandem.COM>
Source record: 110129

To Mark B. Czarnowski,

The Atari modem you describe is the SX212. I don't know of a current source off of the top of my head, but I'm sure you could find one at approximately that price by poking around a bit.

As for 8-bit software, it takes some digging, but there IS some good stuff still available if you know where to look, and the prices are QUITE reasonable. One source I'm sure you haven't heard of is an Atari store in Boerne, Texas. Here's the story:

For many years Floyd Blunk has owned and operated a truly excellent Atari store in Boerne or San Antonio (it moved back and forth through the years) called Atari-Ville, supporting the 8-bit at first and later adding the ST. His prices were always excellent and his selection of software phenomenal. He offered hardware service, but only typically sold the lower-end hardware that moved in volume.

Early this year Floyd sold the Atari business so as to concentrate on his H&R Block franchise and his Sears catalog store franchise. The new owner had no interest in the 8-bit side of the business and did not take Floyd's 8-bit stock. Floyd therefore moved all the 8-bit stuff, as well as some ST stuff the new owner wasn't interested in, to the H&R Block office in Boerne and has been selling it off at fire sale prices ever since. New, unopened software for my 8-bit I bought for prices ranging from $1 to $4, including things like AtariWriter + and Write 80. I bought backup copies of many of the games my kids play often just because they were so cheap (and I have no Happy). I bought my son a brand-new, never opened XDM121 daisywheel printer for $39.95. Yes, Floyd is quite willing to take phone orders and ship anywhere in the U.S. and Canada.

If you are interested in getting a list of what's currently still available, or just checking to see if he has a copy of something specific that you are looking for, call the H&R Block office in Boerne, Texas. I just dug around looking for a phone number and found (512)249-3024, but I'm not sure whether that's the H&R Block number or the old (now defunct) Atari-Ville number, so you may have to resort to directory assistance.

I hope this helps.

Well I wandered around "The Dungeon" for a little while yesterday so what follows are a few tips. Stop reading if you don't want any.
Sequence should go something like this: Trade a piece of clothing to the Clothes Horse for the Mirrored Shield on level #2 I believe. It's usefull for 2 encounters. If you get the Iron Palm Salve on level III, it's helpfull but not required. Use it before you go to the Gargoyle 'cause he'll teleport you to the Basilisk when you answer his questions right. Answers to the questions in order are SHIPWRECK, ORACLE, BLOODSTONE, SHINGOR. (You have taken the reforged ring & tossed it in the Oracle by now right?) If you use the Mirrored shield & bare hand you should be able to defeat the Basilisk. I took him on after casting dexterity, shadowmeld, & speed W/O the shield & lucked out [Temporial F., wack, Temporial F., wack, ...] You get the Bloodstone after winning the battle. You also have access to the stamina fountain in the SE corner of that level. You're supposed to give the Bloodstone to the Dragon next door to the Gargoyle, but I carried it around for a while since it helps restore hit points. If you chose to fight the Dragon, be ready for a major fight. I think he(she?) has 800-900 HPs. I managed to win one by having 2 or 3 gold horns, a dozen crystals, wands, & a fully charged guild ring, but I used EVERYTHING up & only had 20 or 30 HPs left myself. You get so much loot after the battle you can't carry it all, so dump everything in your guild locker before you take him on, what's left over won't be there when you return. You should have the PAC card by now if you've been following the hints in the game, so the only thing left to do is equip the Mirrored Shield & go down to the 4th level to met your destiny.

The RAMbrant source code was never published. It was sold through the Antic Catalog. BTW, a lot of software uses memory locations required by SpartaDOS (if that is what is running on your harddrive) and are tough to patch. How up are you on your machine language (hex codes as opposed to assembler)? If you own a disk editor with hex search capability, you may be able to track down the CIO calls and change the drive number - still no guarantee that it will run under your DOS however....

This looks like the beginnings of another section of the FAQ, or even its own list. Would you be willing to be the KotL for this info? I'm sure newcomers would be interested in a list of all the major products for the Atari 8-bits along with a one-line description, starting with the products of Atari itself. This should also include such almost products as the 1450XL. Or does this list exist somewhere already so that I'm just displaying my ignorance?

>their names in there works. If the law does indeed state that the copyright
>falls back to the programmer if a company collapses, then my opinion
>certainly changes in that respect.
I think that depends on the contract that the company made with the programmers. If the programmers were employees, then the odds are that they have no rights to the software whatsoever. If the programmers sold the completed work to the software company, then it would be likely that the copyrights would go back to the programmer. If nothing was mentioned in the contract, however, I think that the copyright wouldn't default to them. The copyright is property, just as the office furniture of the software company. If the company went belly up, then likely all remaining assets were sold to some liquidator who would now inadvertantly own the copyrights without (possibly) even knowing it. This is, of course, speculation.
Are there any lawyers out there who know about this stuff? Any programmers who know who has the rights to what they wrote?

The issue now is to track down who owns the copyrights. Then we need to get the Atari implementations released for public distribution. Anyone approaching copyright holders should avoid the phrase "public domain." Especially if the company is still selling software for other platforms,

they will want to retain the rights to the name/concept of the software.
Perhaps the best suggestion is for them to sign a statement granting a license
for every owner of an Atari 400/800/XL/XE system to use their software
on that system. Such a declaration would protect the company from loss
of control of implementations on other platforms while making the software
effectively public domain for the Atari 8-bit community.

Perhaps someone should write up a proposed statement for copyright holders
to issue that would protect their rights while making the software available
for Atari users.

Remember all those reviews and photos of the 1450XLD in _Compute!_ and _Creative Computing_? Am I the only one who looked closely enough at one of the photos to notice that the nameplate didn't say 1450XLD? It said 1250XLD!!! Was this the same thing with the number changed for marketing, or did Atari originally plan on the 1250 as a complement for the 1200 and just re-used the case for the prototype/photos?

Or am I just seeing things?

To the individual in Deutschland who wants the 65XE:

Are you aware that there is a difference between Atari 8bit computers manufactured for the North American market and the European market? The North American machines use NTSC video and an internal clock based on 60Hz and 120VAC power supplies, and the European machines use PAL video and an internal clock based on 50Hz and 220VAC power supplies.

Say, pal, any objection to sharing the cross-assembler? :^) Sounds pretty nice, but to write my own would be way too big of a project - I don't have one tenth the time that would require!

Which workstation are you on? I'm on a SPARC 2. (I wouldn't expect any hardware-specific stuff in your cross-assembler, tho.) Seriously, would you mind sharing? That might just be the ticket that would get me back into hacking assembly on my trusty 800!

Thanks,

> (Newell 1 MEG 800XL, 1 MEG MIO, and hard drive, and typed the following:
>
> TIME
> DATE
> KEY ON
> COMMAND
I am confused about this. TIME, DATE, and KEY on are all fine, but what
is COMMAND for? Isn't this just loading COMMAND.COM back on top of itself?

> PATH ON
What is PATH ON? PATH is an environmental not a command. PATH ON would
just set PATH=ON and PATH needs to be a series of directories.

> IBM ON
IBM ON ??? There is not and IBM command on the SDX cart! (There is an IBM
command as part of PROKEY.COM but that only works with SD3.2) I have also
noticed that no error is produced if I type an invalid command after typing
COMMAND. It simply ignores the line.

> ?
This just loads a file with a one charactor filename. In most cases this
is X.COM from the cart.

> After hitting return on the question mark line, the system locked up. It locked
> up 5 out of 5 times.

I tried this sequence with no lock-up, only an invalid parameter on the ? line.
All of this is based on a 256k 800xl (RAMbo), 1 meg MIO, with SDX (4.19).

3096. LYNX Hardware Questions - Porting Games to XE's

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-31 01:15:45 UTC
From: shanej@eskimo.celestial.com
Message-ID: <1992Jul31.011545.10048@eskimo.celestial.com>
Source record: 110144

It's my understanding that ATARI's LYNX Gamesystem is a 6502 based game machine... How hard/is it possible to convert games for a LYNX to the XE/XL/400/800/1200 Series and for that matter the 5200? I know the 5200 had many of it's games ported/converted to the XL durring the "Piracy" Era... (back when people actually cared at Atari)

I've been thinking of purchasing the LYNX, and making the conversion to play the games on my XE when at home. (Possibly purchasing 2 LYNX's to do it and making a special CART slot for the LYNX games.)

3098. 160 x 192 x 16 mode

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-31 05:08:54 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <J6FRoB1w164w@cyberden.uucp>
Source record: 110148

I'm wondering how difficult it would be to make a 160 x 192 x 16 shade mode. It would come in very handy, esp. when making Computer Eyes captures (unfortunately, there'd have to be a program made specifically for doing the 16 shade mode... or perhaps since I believe the capture software (the "Executive") is in the PD, someone could just add this feature onto it.) Anyways. I see it being done just like a Pryzm mode, except instead of using alternating 80 x 192 x 16 grey/color modes, just alternating 160 x 192 x 4 grey screens. (page flipping, or doing it like APAC interlaced and EscalPaint do it..) Another neat idea is a 256 grey shade mode (80 x 192 .. I've made 80 x 96 by altering the APACmode code I have) or even 256 color mode done with 2 80 x 192 x 16 COLOR screens, instead of 1 80 x 192 x 16 color and 1 80 x 192 x 16 grey screen. Perhaps one screen would have a lower luminence value than the other? I'm not sure what exact purposes any of these modes except the 160 x 192 x 16 grey would have, but they all seem pretty easy to design because they are only variations on exsisting graphics modes.

Anyways.. anyone up to it? Also.. does anyone have code for Pryzm/EscalPaint/Interlaced APAC modes (esp.easily added to a BASIC program ;-)). I'm beginning to find 80 x 96 as a little blocky.

Thanx in advance for the latter. All comments welcome on the 1st bit.
later Bill
(constantly looking for niftier graphics modes!)

"Be seeing you!"

3099. CX85 Keypad

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-31 05:14:36 UTC
From: tatmanl@terapin.com
Message-ID: <tatmanl.0yz0@terapin.com>
Source record: 110146

I want to try to hardwire the Atari CX85 Keypad to an 800XL. Has anyone done this before? Is it just a matter of tracking the traces from the #s on the 800XL keyboard to the cable that goes into the motherboard and then splice in the corresponding keys from the keypad?

3100. Racal-Vadic 9600VP

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-31 05:19:41 UTC
From: tatmanl@terapin.com
Message-ID: <tatmanl.0yz2@terapin.com>
Source record: 110145

I know this isn't Atari specific, but maybe one of my fellow Atarians has had some experience with this modem. I picked up a Racal-Vadic 9600VP at a junk store for $10bucks. I Thought this was a 9600 baud modem by the name on it. It seems it is just a 1200 baud modem. Has anyone ever used this specific model? Also, is anyone familiar with the Racal-Vadic modem commands. This thing seems to respond to most Hayes commands, but I think Racal had there own commands as well. Thanks

3102. Re: Piracy discussions always miss this point

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-31 14:33:15 UTC
From: trek@cbnewse.cb.att.com
Message-ID: <1992Jul31.143315.15861@cbnewse.cb.att.com>
Source record: 110150

One issue I have not seen discussed in regards to pirating software is the harm that it does to the original purchasers of the software who, for whatever reason, decide they would like to sell their collection. (Yes, I know some software has non-transferrable licenses but most, especially the games, don't have that restriction.)

With piracy rife, the amount the seller will get for his or her software is negligible. If piracy were not occurring, then the free market place would set that price for the software that had made it into user's hands. The price for some coveted software may actually go up in value. When the prices rise high enough, the software will become available, believe me.

It is this aspect of computers that has helped me to become somewhat disillusioned with "home computing". It is the fact that if I have made a purchase and been dissatisfied, my chances of redeeming any of my original costs through selling the items second hand are hurt by piracy that leaves a sour taste in my mouth.

My future inability to sell off a computer system - and more importantly - its software, which usually cost more than the hardware, that will keep me clinging to a computer system to which I have little interest in instead of upgrading to a newer computer system. It is also that aspect which makes me consider a computer purchase for so long before taking the final plunge. I figure the expenses of the hardware and software are mostly money down the drain with little resale value - so I am unwilling to pay much for either software or hardware. When you buy a computer, that feeling of imprisonment begins.

(Talk about slowing down trade - and yes, I know that it is the exchange of money for goods that keeps an economy humming so my actions, partially due to pirating, are probably partially -or believing our current candidates for office - completely responsible for the current economic downturn. Durn.)

Wayne Booth
(Thoughts expressed are obviously my opinion only since they have not appeared elsewhere in the discussion. I take full responsibility for them.)

I still can see the original via Portal, if you can't see it, it may be your system has a ban on anything commercial. Talk to the adminstrator & see if he (or she) will move it to a private mail box or something.
BTW: I have no $$$$ interest in any of the firms I mentioned.

3104. Old Atari 8bit software

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-31 15:09:42 UTC
From: ahmeda@gtephx.UUCP
Message-ID: <1992Jul31.150942.7080@gtephx.UUCP>
Source record: 110059

While cleaning up my garage I came across some old software from my old days
of computing on an Atari 800. Here is the list.

Software:

Extended Fig-FORTH
Deep Blue C Compiler
Atari Macro Assembler & Program-Text Editor
OS/A+ operating System
TeleTari Terminal program
SAM Speech Synthesizer
Choplifter
Zaxxon

Books:

Inside Atari DOS
The Atari BASIC SOURCE BOOK

All have original Disks and Manuals, except Zaxxon, which is disk only.
All this software has been laying around in my garage for the last 8 years
so there is no guarantee that any of the disks are any good. I will sell
these to the first person for the enough money to cover postage and my
troubles for packing and mailing (postage and handling). So is there
anybody willing to give me $20 for all this.

Aftab Ahmed (ahmeda@gtephx) | Copy Protection. noun. A means of

3105. Atari 8bit stuff (where to get it?)

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-31 17:33:07 UTC
From: brs@cs.brown.edu
Message-ID: <BRS.92Jul31123307@tahiti.cs.brown.edu>
Source record: 110152

Does anyone have info as to where any of the 8bit machines and peripherals can be obtained? How about software?

I had several Atari 800 machines and just recently dug them out of storage. Unfortunately, it seems not all the machines work anymore, and I seem to have lended out parts that never returned. Anyhow, I would be interested in how I might purchase some of the old stuff. How about those books, like "The Atari Memory Map" books, or the schematics and os assembly code listings that used to float around at user groups. Is any of this stuff available still?

Brian - rediscovering the Atari was an extremely advanced machine

3106. Jay Miner - father of which Atari machines/chips ?

Newsgroup: comp.sys.atari.8bit
Date: 1992-07-31 18:29:56 UTC
From: drudetb@infonode.ingr.com
Message-ID: <1992Jul31.182956.15704@infonode.ingr.com>
Source record: 110154

Here's a trivia question for diehard Atari fans:

Exactly which machines and/or chips was Jay Miner responsible
for engineering while he was at Atari?

I know Jay is widely acknowledged to be the engineering "father" of the
Amiga architecture. But before that he worked at Atari for years.

From various sources that I've heard that he supposedly designed:

- The 2600 VCS - the TIA chip (aka "Stella")

- The Atari 400/800/5200 - the Pokey and Antic chips (maybe others?)

- What else did he design? (Please quote sources if possible.)

Thanks,

- Ted Drude (drudetb@infonode.ingr.com)

3107. atari 800 monitor cable

Newsgroup: comp.sys.atari.8bit

Message-ID: <1992Jul27.014733.25311@mailer.cc.fsu.edu>
Source record: 110055

I have a atari 800xl and a ibm pc. If have pirated software on both systems. I have been doing it long on the atari since I have had it since the begining of 85 and I did not get the pc til 89. Between the atari my father had (since 82) and the computers I own, I have pirated many thousand dollars worth of software. As a freind of mine stated (I agree), if the software was priced reasonably, we would actually pay for it.

NO NO NO the SPA is NOT going to fry you for pirating software for an "outdated" machine.

Bob

>
>Oh well... one day that'll hopefully be fixed.

Here is one serious problem with disk-swapping. For DD3 to run on 48K Ataris, only one font can be held in memory at once. So just changing fonts a few times would require multiple swaps. And if the font is taller than 16 pixels, the number of swaps would then be doubled, because all fonts would have to be reloaded for the second set of print head passes. It seems to me to make more sense to just waste some disk space to relieve the user the hassle of many, many disk swaps throughout a reasonably sized document with many fonts. The ideal situation, of course, is to have a RAMdisk. Just stick all the fonts you need, (and even the text file) into the RAM disk and then printing will be much faster and be kinder to your disk drives too.

Does anyone else see real use in a disk-swapping option?

- Cleaned-up comp.sys.atari.8bit/Info-Atari8 Digest descriptions
- List of Atari hardware for the 8-bit <- I need a little help here.
- Spiffy new title page!

The 8-bit Atari
Frequently-Asked Questions List
for the Internet

Posted on or about the first of the month, simultaneously to:

the Usenet newsgroup
comp.sys.atari.8bit

and

the Internet mail-list
Info-Atari8 Digest

which are, in fact, one and the same group.

Revised 31-Jul-92

additions/corrections/comments to Michael Current (currentm@carleton.edu)

What is comp.sys.atari.8bit?
comp.sys.atari.8bit is the Usenet newsgroup dedicated to the free
exchange of information pertaining to the 8-bit Atari computers:
the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, and the XE Game System. All
postings to comp.sys.atari.8bit automatically appear in the Internet's
Info-Atari8 Digest.
Users of Atari TT, STe, or ST computers refer to comp.sys.atari.st.
Users of Atari Portfolio computers refer to comp.sys.palmtops.
Users of Atari Lynx, 7800, 2600, or 5200 game systems see rec.games.video.

What is the Info-Atari8 Digest?
The Info-Atari8 Digest is the Internet mail-list dedicated to the free
exchange of information pertaining to the 8-bit Atari computers:
the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, and the XE Game System. All
contributions to the Info-Atari8 Digest automatically appear on Usenet's
comp.sys.atari.8bit.
To subscribe or unsubscribe to the Info-Atari8 Digest, send
e-mail to Info-Atari8-Request@naucse.cse.nau.edu.
To contribute to the Info-Atari8 Digest, send your posting to
comp-sys-atari-8bit@ucbvax.berkeley.edu.
```

Please note: there is NEVER a good reason to send anything to the address Info-Atari8@naucse.cse.nau.edu.

What is the atari.archive?
atari.archive.umich.edu is the Internet site which contains many files for the 8-bit Atari computers. The 8-bit Atari Archive Moderator is John Dunning, jrd@stony-brook.scrc.symbolics.com.

How do I download files from the archive?
Two methods:
1. If you have FTP access you can FTP to atari.archive.umich.edu (141.211.164.8), login as "anonymous" and type in your e-mail address as your password. Now type "cd atari/8bit" to reach the 8-bit directories. If this is your first visit to the archive, be sure to download the file -read-.-me-. Other files of interest are 8-bit.cat, containing 1-line descriptions of all the files available, and 8-bit.text, which contains paragaph-long descriptions. Be sure to have file-type set to BINARY when downloading binary files (.arc, .com, etc.)
2. Send mail to BART, the atari.archive file-server. BART's address is atari@atari.archive.umich.edu. If you are a first-time BART user, send it a message that says:

help
send 8bit/-read-.-me-
send 8bit/Index

BART automatically UUEncodes binary files before sending them to you.
Other files of interest are 8-bit.cat, containing 1-line descriptions of all the files available, and 8-bit.text, which contains paragaph-long descriptions.

How do I upload files to the archive?
Three methods:
1. FTP to atari.archive.umich.edu (141.211.164.8), login as "anonymous", type in your e-mail address as your password, and then type "cd atari/8bit/new". You may upload files to this directory. Be sure to set file-type to BINARY if uploading a binary file (.arc, .com, etc.) Also, please upload a short .text file describing your upload so John Dunning can tell what permanent directory to move it to.
2. Send your upload by e-mail to jrd@stony-brook.scrc.symbolics.com. If you're sending a binary file you must UUEncode the file first. Be sure to include a short descrption of the file at the top of the message so he knows what directory to place it in at the archive.
3. If you can neither FTP to the archive nor e-mail to John Dunning, then you are welcome to post your file, UUEncoded if binary, directly to comp.sys.atari.8bit. You'll then be relying on someone else to take your posting and upload it to the archive for you.

What is Z*Magazine?
Z*Magazine ("Z*Mag") is the International Atari 8-Bit Magazine, published monthly. It covers the 8-bit Atari computers exclusively.
To have Z*Mag delivered "right to your own mail box," send a message to Ryan 'Gozar' Collins at rlcollins@miavx1.acs.muohio.edu, asking him to add

your address to his Z*Magazine Distribution List. Back issues of Z*Mag are available at the atari.archive in the /atari/8bit/zmag directory, in filenames such as zmag204.arc.
To reach the publishers of Z*Magazine, contact Ron Kovacs at 75300.1642@compuserve.com, or Jon Clarke at jonc@status.gen.nz.

What are the News-Disks?
The Atari 8-bit News-Disk ("News-Disk") is an on-disk Atari 8-bit only magazine from the UK. It is sent on-disk to subscribers in the UK, but is also made availble to people with email or FTP access. Each issue is supplied in ARC format. They are not in straight text format like Z*Mag. Each issue contains articles on various aspects of the Atari, along with programs in Basic, Turbo-Basic, and M/C. Some issues also contain .PIC files (viewers always included), speech files, and some others. Every issue contains a copy of XR_40 for viewing text files on the screen, and a copy of a simple program to print articles. Alternatively, you can read/print from any word processor. Each issue should be unARCed onto a single density disk with a copy of DOS 2.5 DOS.SYS on.
All issues are at the atari.archive. They are accessed by '/atari/8bit/djg/issueX.arc' where X is the number of the issue desired.
To submit articles, mail djg0@aber.ac.uk.

What is the Cleveland Free-Net Atari SIG?
The Cleveland Free-Net is like a huge public bulletin board system, and it is the hub system of the NPTN, the National Public Telecomputing Network. Anyone can access the Free-Net via modem at (216) 368-3888. Those persons with full Internet access can TELNET (this does not mean FTP) to freenet-in-{a,b,c}.cwru.edu (129.22.8.{47,48}). Applications for accounts are handled online. Once logged-in, type "go atari" to reach the Atari SIG. Those who add their names to the Atari SIG user directories are automatically members of the official Atari user group CAIN - Central Atari Information Network.
The Atari SIG carries Z*Magazine and the Info-Atari8 Digest, as well as many product reviews and all sorts of other information related to Atari products, all online. Its mission for 8-bit users is as a depository for any and all information in ASCII format related to the 8-bit Atari computers.

What product developers or vendors support the 8-bit Atari?
Ray Wilmott maintains a list of current 8-bit Atari vendors and
developers which is too long to include here. Contact him at
wilmott@remus.rutgers.edu

What is an .arc file?
A file with the extender .arc has been archived, in a standard manner that
is common in the IBM-PC/MS-DOS world. This is done to make the file shorter,
so it takes less time to transfer between computers. The atari.archive
contains an un-arc'er called supunarc.com for the 8-bit Atari. The companion
program is called superarc.arc (use supunarc.com to un-arc it). Each is
compatible with the MS-DOS equivalent.

What's this UUEncoding stuff all about?
UUEncode/UUdecode is a UNIX utility that will convert a binary file into
100% printable ASCII characters, so that the file may be posted or e-mailed
anywhere a text message can go. The 8-bit Atari is perfectly capable of
UUEncoding/UUdecoding as well. The file uudecode.bas (the documention file is
uudecode.doc) is at the atari.archive. It's in Atari BASIC text format (ENTER
it into Atari BASIC). The file yau.arc contains yau.com, a machine-language
UUdecoder, and yaue.com, a UUEncoder for the 8-bit Atari. Each is compatible
with the UNIX equivalent. UUEncoded files are given the extension .uue.

Can I read/write 8-bit Atari disks on an IBM-PC?
There are no fewer than 5 programs at the atari.archive that claim to
achieve this, at least to some extent. They are:
pcxfer.arc - Predecessor of all but sr.arc. No recent usage reports.
util.arc - Perhaps the most widely used; archaic instructions, but works.
dskutil.arc - Reputed to be a cleaned-up util.arc.
atario21.arc - Also an improved util.arc, but only read, no write.
sr.arc - Stands for Sparta Read, for SpartaDOS format disks.
Each of these programs runs on an MS-DOS type of computer. For disks written
on your PC to be read on your 8-bit Atari, you must have an Atari disk drive
capable of accessing at least 180K, SS/DD disks. That is, an XF551, Indus GT
or equivalents, but not an unmodified 1050 or 810. There is no way to write
128K or 90K Atari-format disks with an IBM-PC. You will also need either
SpartaDOS or MYDOS on the Atari.

What's the best DOS for the Atari?
This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system. MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support. SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2D is disk-based; SpartaDOS X is cartridge-based and includes many additional features. While it's hard to argue that SpartaDOS X is not the most advanced DOS available, it is a commercial product that is no longer manufactured. MYDOS, on the other hand, is a shareware product that continues to be improved upon. It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. MYDOS is available at the atari.archive.

What are the best telecommunications programs available for the 8-bit Atari?
It all depends on what type of computer you intend to connect to. For connecting to Bulletin Board Systems, BobTerm is the unchallenged favorite. For connecting to larger computers, you will need a VT100 emulator. Several are available for the 8-bit Atari, each with its own advantages. Kermit-65 is a VT100 emulator, provides Kermit file transfer and an 80-column screen display, but does not support the XEP80. VT850 is a VT100 emulator that supports the XEP80 but provides no file-transfer. OmniCom is a VT100 emulator providing both kermit and xmodem file transfers, plus an 80-column display, but does not support the XEP80. Each of these programs is known to work with the SX212 Modem connected to the SIO port, and to work under SpartaDOS and MYDOS; each program is available at the atari.archive.

What hardware has Atari created in the 8-bit computer line?
This is a brand-new listing. If you can, please help me with the information I don't have, or correct me if I got anything wrong, or tell me what else you want to see here! -Michael

410 Program Recorder (2 versions, see the Best catalog)
810 Disk Drive (SS/SD 90K with DOS 1 or DOS 2.0S)
815 Dual Disk Drive (2x SS/DD 180K with DOS 2.0D - never sold)
820 Printer (40 col.)
822 Thermal Printer (40 col.)
825 Printer (80 col.)
830 Modem (300 baud acoustic, with Telelink I)
835 Modem (300 baud, with Telelink II)
850 Interface Module (???What are the ports on this again???)
1010 Program Recorder
1020 Printer/Plotter (40 col.)
1025 Printer (80 col.)
1027 Printer (80 col., letter quality)
1029 Printer (??? - never sold in U.S.)
1030 Modem (300 baud, with ???software)
1050 Disk Drive (SS/ED 128K with DOS 3 or DOS 2.5)
???XC11 DataCassette (never sold in U.S.???)
XM301 Modem (300 baud, with ???software)
XMM801 Printer (80 col.)

XDM121 Printer (80 col., letter quality)
XF551 Disk Drive (DD/DD 360K with DOS XE)
XEP80 Interface Module(80 col. video display and DB25 parallel port)
SX212 Modem (1200 baud, rarely with SX-Express! package)

End of FAQ list.

I have heard from two prominent 8-bit vendors/developers that have been interested in buying ICD's 8-bit line. Both tell me ICD is asking much more that either is willing to pay. Oh well, ICD has the right to ask whatever it wishes...

>internal clock based on 50Hz and 220VAC power supplies.

I just want to point out that the 50/60Hz difference is not important;
the Atari machines, like most computers, do all the timing with a quartz
crystal, and don't care about the power line frequency. The power
supplies just rectify it and the actual power requirements of the
computers are DC only. The video format is probably the only major
problem since all you need is a (commonly available) 220VAC -> 110VAC
transformer to adapt the wall supply.

Message-ID: <1992Jul31.230540.24335@ucunix.san.uc.edu>
Source record: 110062

I just made a cool new NULL cable to connect my ST and 8 bit computers.
From what I've read, I thought all that needed to be done was that I
set both computers to the same baud and transmit away. Does anyone out
there know how to do this (I'm trying to bulk dump a ton of files to
the 8-bit) and if so, what hardware/software did you use?
Thanks.

Re: Pirating and we all do it or something like that.

PERSONALLY... the only pirate stuff I have were games that I'm not sure I even HAVE anymore that I got about 5 or 6 years ago! Any OTHER pirated stuff (which I'm not aware is pirated... like Draconus. We still don't know if it's PD or not!) I probably got STRAIGHT FROM THE ATARIBASE BBS, Atari Corp., San Jose, CA!!!! (like Atariwriter+ pirated. I had to scream my head off at Bob Brodie about validating that because I payed $50 of hard earned cash for it and here it is sitting there FREE). I'm VERY against pirating. I have a copy of S.A.M. that I could easily copy and not tell the person (Bob Woolley) about when I send it back, but I'm not like that. I'd rather buy it from him, but he's just lending it to me.

So don't go around screaming that we're all a bunch of pirates matiee! (sorry..had to)

Anyways.. when I see pirated stuff on BBSes I yell at the sysops. I think we all should. And just because Jeff couldn't convince those idiot software companies to release or re-sell their old wares doesn't mean that a group campaign won't work! Eh? The only reason I don't go around bugging companies for software is because I think most of the PD stuff out there nowadays (APACView, BobTerm, TurboBASIC XL, etc.etc.etc.) is better! Sorry for ranting and raving, but "fight fire with fire!"..

Perhaps Jeff could post all the company addresses/phone numbers so we could all help him out (I'd help- tho I'd probably never buy anything myself from these places..)

Anyways. I do see your point. (both of you) But I resent being called a pirater..

> does anyone really believe that any of the old 8-bit software that is no
> longer on the market will ever be re-released for the 8-bits? I didn't
> think so.

Jeez. Let's see (this is from the limited list that's in my brain...)

Power Per Post - Makes/sells Quick & S.A.M.
K.O.Products - Sells not only PD but also 2 great games from Poland.
K.E.Software - Sogon, Drag, Dredis, Cultivation, Zebu-Land, and about
Chromatics, Oblitroid, Tobot, Bros., Techno Ninja, Zador
Alpha Systems - Magniprint II+, Parrot II, Pop-N-Rocker, Scanalyzer, etc
(I must admit, these are probably just stock these days)
(but the catalog listing this IS new)
Starfleet Softw- Plenty of XMM801 printer utilities.
C.S.S. - Hard Drive Pro Backup, Super Archiver (I&II), Bit-Writer
Disk Cracker, Richman's Word Procassor, NOT To mention
all the EXCELLENT hardware they produce and are still
designing!
!?!?!?!?!?!!?! - ChromaCAD 3-D. It's listed in American Technavision's
catalog, but I don't think they produce it.

And after all that there's still all the excellent >PD< and >Shareware<
stuff out there, still being made and updated. Textpro is rumored to be
coming out as version 5.x soon. BobTerm's still being worked on, with
any luck I can convince Jeff Potter to add some features to APACView and
ColrView <snicker>.

So you see.. stuff is still coming out as <NEW>. And if that's not
enough, there are "<NEW>" as in "unused" software floating around
everywhere (B&C, Best, American Tehcnavision, Telegames USA, San Jose
Computer). Not to mention the 100s of PD software outlets.

Like somebody said in an earlier post (perhaps just part of their .sig):

"Atari Classics aren't dead. They just look like they are."

I suggest sending out postcards (19c!) to every company you can think of
asking for 8-bit software catalogs. I have many a scribble on the ones I
received thanking me for my interest. 8-bit supporting software/hardware
companies are posted ever so often on the net, so they're not far out of

reach!!!

(BTW: >I< still make software on my 8-bit. In TurboBASIC XL and I don't sell any of it.. just put it in the Public Domain.. but it's still software and >I< support my software! ;))

Remember the "2600->800" discussion from a few weeks ago?

This is like that, only worse (or, you might say, at the other extreme).
The 2600's graphics routines were too primitive for the 800, and the
Lynx's are too advanced. Everything I've read about the display hard-
ware indicates that the Lynx has hardware routines for instantly
rendering 3-D perspectives. That alone would be impossible for
emulation software to achieve in real-time. Screen resolution wouldn't
be a problem - I think the Lynx's is smaller than the computer's. BUT
the Lynx can display 4096 colors simultaneously (I think). And no,
APAC isn't the answer for real-time games.

I would bet that this will turn out to not be any more fruitful than
the possibility of writing a 2600 emulator. Nice thought, though.

> Does anyone have the pinouts of the atari 800 monitor jack? I seem
> to have lost my only cable.

According to Compute's Mapping the Atari, the pinouts on the 800
and XL/XE monitor jack are:
Pin# What_It_Does
1 Audio Output
2 Composite Chroma**
3 Ground
4 Composite Video
5 Compostie Luminance

**Not supported on XL models

This pinout is as if you were looking at the side (or back)
of your computer with the little notch on top. Pin 1 is just
to the left of the notch and pins 2-5 follow in a counterclockwise
manner until pin 5, which is just to the right of the notch!
Follow that??? If not, e-mail me, I'll draw an ascii-pic er
somthing!

I always opt for BBK art. It doesn't have DLI's for varying colors every scan line, but it has a few other nicities like printing text to screen, x,y position report, etc. It was on Analog #56 & came with the source code included. You can find it on most BBS's that support the 8-bit. I've got the original issue of Analog, but I know it's also on CI$ & Atari Base.

Just one correction (I think): You should be able to access a 1050 disk that was created in density & 1/2 on an IBM. The problem is the ibm controller will not read FM, just MFM disk. A side note, at one time I wrote a short program (two really, one for each computer) that would write files to the first part of sectors on an ibm 360k disk & could be read by a doubled 1050. Minor whine, but I posted messages on CI$, Atari Base, Carina NET, etc. for somebody with a stock 1050 to help me check if it'd work in that config. I figure I reached about 7,000 8-bitters at the time & got '0' offers of assistance. Anyway, if there is anyone still out there with a stock 1050 & an IBM that actually needs this capability, let me know, I may be able to dig up the old disk. I doubt if I could find the original Turbo C code, but it wouldn't be to tough to reproduce.

If I'm using an 850 or PR: I usually use Uniterm on the ST & Express on
the 8-bit. Minor annoyance is I've not fooled around with the 8-bit
to ST transfer program that came on the old Antic disks. You get a few
padded characters with the Xmodem send I believe. I've also used Express.MPP
for transfers using a modified joystick, but 300 baud Xmodem trasnsfers are
a little slow.

The best way of transfering data between an 8-bit and another computer is SIO2PC--it allows another computer to pretend that it's an Atari disk drive. It attaches to the Atari through the SIO daisy chain. It attaches to the other computer through the RS-232 port. Unfortunately, the software to handle the RS-232 port is only available for PC clones. Is anyone interested in writing SIO2ST? SIO2MAC? If the original code wasn't in 8088 assembly, it would be a lot easier to port, but Nick Kennedy should be able to provide to specifications for the protocol he's using.

Instead of a 65C02, what about the 65802? It is pin compatible with
the 6502. It is very much like the 65816, but with only a 64K address
space. I might get around to trying it soon in my 400, to see what
problems might arise, but the Apple][guys have been doing this for
awhile.

I hadn't realized that 48K limited the flexibility of the program, but as an 800 owner, I want to publicly thank you for keeping it compatible with these computers, unlike so many other developers. (As it so happens, I do have a 512K RAMdisk, but it would do me no good if your program didn't work in 48K of "main" memory.) Thanks again for not orphaning us 800 owners!

Is it just me... or werent the "Sears Telegames" just 2600 with Sears'
name on it...? If I recall, back then EVERYTHING they sold had to have
their name on it. (I have "Soccer" (ala Pele's Soccer) and
"Steeplechase" (was it ever released as a non-Telegames title?) which
were "telegame" games and they work 100% with my 2600!)
hmmm... I guess Sears was funny back then.

1) I hATE you! 1 meg 800xl w/ a 1 meg MIO!!!? <sniffle sniffle>

2) maybe it's an "anti-IBM" feature!?!? :) (seriously, tho..I'll take
it "IBM.COM" is that MS-DOS "emulator" program? or did you just type
that in for fun!?)

Anyone have memory upgrades they'd donate to me!? ;) jk..

I must admit tho.. I NEED A HARD DRIVE!!! (David Richardson's "DD3
Users Manual" takes FOREVER!!!! or maybe it's just XMM801 printers are
slower than the rest of the ones DDIII supports???)

True... but 1 thing... the guy (name avoids me) who invented velcro patended it... then never had a chance to make (much) profit from it because no one was interested.. he fought for the laws to be changed from 17 years to lifetime, but of COURSE I don't think that applies to software (look at the tech.advances in merely the past >10< years.. 17's pretty big in itself!)

Ah.. but it's not just the F-keys I want! I love my large [DELETE]
key! And after 9 years I've gotten VERY used to hitting it w/ more
than one finger. If I have that damned [BREAK] key there I'll hit it
ALL THE TIME!! :(<sniffle>. Perhaps if I swapped OS
chips?!
hmm

3138. List of AtariWriter Printer Drivers

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-02 12:59:16 UTC
From: gary@mcsiad.UUCP
Message-ID: <324@mcsiad.UUCP>
Source record: 110095

After posting a message to 'atari.8bit' a few days ago about the availability of my AtariWriter Printer Drivers for the old AtariWriter cartridge, I received a surprising number of responses. Many asked the same question, as to whether I supported a particular printer!

What follows is the basic list of printers for which I sell individual Printer Driver diskettes. Please understand that these only support the original AtariWriter cartridge and DO NOT SUPPORT the AtariWriter Plus product(s).

You can order a Printer Driver for the original AtariWriter cartridge to support any of the following printers by sending a check and indicating which printer you own.

3139. 800xl Tech Notes/65xxx Specs.

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-02 20:38:06 UTC
From: a644690c@edinboro.edu
Message-ID: <0095E80A64B9C160.2020204C@edinboro.edu>
Source record: 110101

'De Re Atari' mentions that Atari produced a set of Tech. Ref. notes for
the 800XL but they were never sold. Is it possible to get these? How?
I have the complete set for the 400/800 but it is only of limited help
with my 800XL.

I think this may have been discussed here already but... Does anyone know
where to get spec. sheets for the 65xxx processors? (or even who would
sell those processors?) I have the first class of a Microprocessor Inter-
facing and Design series this fall and we have to do a project. I think
using a 6502 or 65802 would be inexpensive yet understandable enough
for an electronics project. Any help would be greatly appreciated.

Just out of curiosity; does anyone know the complete list of 65xxx processors?
This is what I know of:
6502 / 65C02 / 6502A / 6502B / 6502C
6507
65802
65816
65832

Are there others?

Thanks,
-Adam Conover.

I'm moving and as I go through the stuff in storage I am putting aside all my old Atari stuff. I don't want to store it anymore so out it goes. Rather than set it out for the garbage man, I thought someone might want it. I know there's an 800 and a 400 and some cartridges I haven't unearthed yet, but I will. There is much other misc things like OS carts, many 16k RAM carts, and even a bag-o-chips. What I have found is 2 brand new (?!) pen plotters STILL IN THEIR UNOPENED BOXES. I paid $50 each for these in 1984.

I don't really feel like shipping these, unless you really want to make it worth my while, so hopefully someone in the Bay Area can drop by and pick this stuff up. First come first served, unless someone actually offers me money for it. I'll be moving throughout the month of August so I can post later with a more accurate list of items; if no one responds by then.

I don't read this group so please respond via email to the address below.

Source record: 110088

Anyone care to diagnose this one?

I have an old 800. It seems to work fine, however, after being on for over 5 to 10 minutes, I can't seem to load certain programs. Sometimes if I swap the order of my memory card (an original Atari 16K and Austin Franklin 32K) things will work, but for some programs they won't. If I leave the machine off for a 15 minutes, I can start it up and whatever I choose initially will work.

Any idea what is overheating? The OS card feels rather warm to the touch (actually, the chips do).

If it turns out I need a new OS card, or memory, where can I get it? I generally work with Sun Microsystems hardware, and there the smallest memory simms are in 1 MEG increments. Sheesh! It's amazing the quality programs people have written in under 48K. Where, oh where, can I get 16, 32, or 48K cards for the trusting old (senile) 800?

Thanks for any info,

Brian

3143. Atari Tech Ref Notes: who wants em?

From: clf3678@ultb.isc.rit.edu
Message-ID: <1992Aug3.012602.6151@ultb.isc.rit.edu>
Source record: 110091

I noticed a day or two ago that somebody asked about ICD selling the rights to their no-longer-produced 8-bit products. As I work for CSS (one of ICD's competitors), here's what I know about it.

We had some informal talks with certain ICD employees about what they were doing with the 8-bit things that they no longer manufacture. We gathered that they wanted to sell the rights to the products, and had talked with some other companies.

I believe that they wanted to sell the rights to ALL of their products in one shot instead of selling rights of certain products. They were also stressing that whomever bought the rights MUST continue to make the products. They wanted to make sure that the plans didn't wind up on a shelf.

I don't remember just how much they wanted for the rights, but I do remember that I thought the amount was quite high. Last I heard, ICD never did find somebody to buy the rights, and were no longer looking to sell the rights. I may be wrong about this point, but then again, we're not really interested in their stuff. Ours is better. :^)

I don't know if this is your problem, but I had an Asteroids cartridge that would lock up at times--it seems that the contacts were dirty. I'm not sure what the recommended procedure for fixing this is, but two that I've heard of are using a pencil eraser to "erase" the deposits and using rubbing alcohol with cotton swabs (be sure it's dry before turning it on). I think the eraser fixed my Asteroids cartridge.

As to getting replacement stuff--I had good luck posting a "I need x" message. It seems that there are people who bought several machines and would happily part with parts from a broken one.

BTW: I think that it's not unusual for Atari stuff to heat up a bit. You could put a fan inside the 800 if you find you need it--I think there's some space in the back-left corner.

This is part 1 of my partial SpartaDOS utilities list. In the following
messages, ignore the obvious communications program filenames (Bobterm, Express,
```

Rscope), however, the discom32 file was obtained off of a SpartaDOS utilities disk.

They were indeed. In fact, the very first Atari game machine I ever
owned was the Sears unit.

>hmmm... I guess Sears was funny back then.

Why the past tense? ;-)

3149. Re: Atari 2600/7800 programming info/specifications sought

>They were indeed.

Ahem... (clearing my throat)

A bit of Sears Tele-games trivia:

- The Atari 2600 and 2600A were both repackaged (just relabeled actually)
as the Sears Tele-games Video Arcade. (Also known as the Video Arcade I).

- Atari also manufactured a custom version of the 2600 (100% compatible
with above) for Sears which they called the Sears Tele-games Video
Arcade II. It was better built (IMHO) than the original 2600, but
offered no new capabilities. Atari never sold a version of this system
under their own name. However the same exact case design for the Video
Arcade II was used for the Atari 7800 some years later.

- Sears offered most of the early Atari 2600 game carts under their own label,
but often with different names (e.g. Sears Gunslinger = Atari Outlaw,
etc.) A couple of Atari games that appear to have been offered ONLY by Sears
are Submarine Commander and Stellar Track.

- Mattel also created a Sears-labeled version of the Intellivision, which
Sears sold as the Tele-games Super Video Arcade.

Much worse. The Lynx runs off a variant of the 6502, yes, but it's running
at 16mhz. It has hardware for scaling (using the same bitmap for close-up
or far-away pictures), something that would bring an 8-bit to its knees.
It has a palette of 4096 colors, but can only display 16 at a time. The
resolution's something like 160x100, or about Graphics 7+.
The problems with emulating a less-powerful system (like the 2600)
are mainly tied to the difficulty in re-doing all the hacks they did to get
the system running. (Ask Dave Small about getting the Mac emulator to work
on the ST...) The problems with emulating a more-powerful system (and that's
not a slam on the 8-bits) are much more complex, and in some cases impossible.
The best way to get Lynx games is to buy a Lynx.

There's most of them, but I do also have a SpartaDOS file sig that has most of what you've seen here in it, but this is about 80% of the SpartaDOS utilities I own.

The obvious files not to consider SpartaDOS utilities are the term programs (Bobterm, Express, and Rscope).

>the opinion I'd already formed of you based on your previous posts - that
>of an immature whiner. You can't even be bothered to stick with the
>ATARI market, so why don't you butt out and stay away from our newsgroups

Because when all you hard code 8-bit pirates grow up and become hard code Mac or PC pirates, it will be my business to make sure you get prosecuted. Actually, I'm sure by posting pro-piracy messages and admitting to the fact that you're engaged in piracy of 8-bit software, you're not only pissing off the FEW ATARI DEALERS that are still sticking around to support losers like yourself, but it's probably enough to get you kicked off the net. Personally I have no interest in doing that since pirating video games is probably less destructive to society than letting you think up others ways to waste away your free time.

I'm actually surprised by your posting in particular. Your rather lengthy signature would indicate that you're some sort of a Jesus freak with morals that would forbid you from stealing software. But it just goes to prove that Atari 8-bit users, regardless religious preference, are still the same. Reminds me of user group days in Toronto about 10 years ago. At 8pm it's the "we don't condone piracy" user group meeting. At 11pm it's the all night Archiver chipfest at the president's house.

Perhaps one of you belly aching 8-bitters should do something other than whine about the lack of support for your machines. Why don't you try opening up an Atair dealership and try to sell some of the software that you currently pirate. And I don't mean sell pirated copies, I mean sell legitimate 8-bit software. There are still dealers that still do that you know. I know people that still actually call them and order software from them. Ooooh, what a concept. What you'll probaby find out is that your fellow members of comp.sys.atari.8bit will soon put you out of business, and then you'll know why Atari doesn't give a shit about vermon like you and why all the developers have left.

Ok, I think that satisfies your criteria of posting a potential solution to the problem. No doubt you will dip into your long list of adjectives and shoot down my idea as crap. Ok, then, sit back, and wait for someone else to open up that Atari dealership and then promptly proceed to put him out of business, and then sit there and wonder why things aren't getting better.

It seems to me like this problem will go away by itself anyway. Assuming all Atari 8-bit developers are gone and no new software is being produces at all, then that means that sooner or later you will have pirated every single Atari 8-bit software title that there is to pirate, at which point you'll get bored and move on to other things to complain about.

What's sad is that you spend so much energy whining about the problem instead of using that energy to if not fix the problem, then take advantage of the problem and benefit from it. Yes, starting a pirating operation is one way to benefit at the expense of your morals, but there are other ways.

- Darek

Try playing a Nintendo some time, it gets dirty contacts on the
cartridges all the time. (Now I realize that Atari was pretty smart by
putting doors on their cartridges.)

Message-ID: <63349@cup.portal.com>
Source record: 110103

I've got a book that includes a 6512 & a 6510. You might try to get a Rockwell product line book, they made most of the 65xx variations including one beasty that was 2-6502 in a 64 pin package. I think Bob Wooley talked to an Atari official about the the xl OS & was told all the info was stored on one of their 4-PDP/11's (or whatever) & nobody thought to save any of the info when they were sold off to raise money.

3164. Re: ICD

Newsgroup: comp.sys.atari.8bit

From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <63352@cup.portal.com>
Source record: 110104

Thanks for the info. I phoned ICD today & told them I'd be interested in the rights to Action!, but taking over the entire 8-bit product line would be beyond my finances. They're supposed to phone back if they'd be willing to break up the set. I let you know if they have changed the status of selling stuff off, but assuming I do get a call, I guess I'll have to treat any info as confidential unless told otherwise. I know a few other people have been interested in Basic XL (I seem to be the only guy left who boots Action!). If they respond, I'll ask about that too.

Ben,
1) Nice intro!! :)

2) That bit about "we have a RIGHT to keep this exsistence"..
that does bring up a good point. The first thing that came to
my mind were those IBM jerks (no offense. You should just SEE
the flames I get for owning my Atari...from little 13-18 year old
phreakers/blue-boxers who've never even seen what one of these
gems can do!.
hmm

btw: how the HELL did 50 messages get posted in one day!? Maybe I've
blacked out a few extra days while printing the DDIII user's guide.
(said while steam still bellows from my aching print-head :))

edinboro.edu) replies:
>You make an interesting point about the actual ownership of software. I
>have always been under the impression that work done for hire or contract
>becomes the legal property of the contractor or company involved.

Adam is correct. Unless you very specifically have it stated as part of
your contract or terms of employment, (the odds of which are nil, since no
employer is that stupid,) ownership of the software is held by the company
and by _no means_ reverts to the actual programmers.

This is just one of many reasons programmers go it alone, of course. It
doesn't have to be that way either. At General Motors, when a research
scientist applies for a patent from research done at GM, G.M. routinely files
the patent in both GM's and the scientist's name.

In 15 years of programming, I have never seen or heard of a similar arrangement
amongst software houses. It essentially doesn't happen.

3172. Digital Music System

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-04 05:32:31 UTC
From: snyder10@convex1.tcs.tulane.edu
Message-ID: <1992Aug4.053231.15549@cs.tulane.edu>
Source record: 109956

I've sent to the Archive Dean Garraghty's PD release of DMS

This is the Public Domain release of Dean Garraghty's

Digital Music System.

The for-runner of Digi-Studio, DMS is similar but only covers one
octave, and is limited by not having real pitch.

The program includes samples, player, keyboard player, drum player
and tune compiler. The tune compiler allows you to play your tunes
within your basic programs.

DMS1.DCM is the Main program disk, it has all you will need to make,
test and compile your tunes.

DMS2.DCM is a disk of samples to add to DMS1.

Enjoy!

Don't talk to me about star trek! I have 1 too many s.t. geek friends
(1 is 1 too many ;))..

naw...perhaps spraying it w/ water!? I dismantled it & looked around and
put it back together, but nothing seems to be wrong with it
nowwww

3178. PPP WROTE ME BACK!!!

WoW! not ONLY have I finally received a letter from my favoritest frined
in boot camp way over in New Jersey...
and not ONLY have I FINALLY finished printing out the DDIII user's
guide..

BUT... I ALSO FINALLY got a reply from Power Per Post! (ala S.A.M.,
Quick, and Atari Magazin fame... (yes..no "e" in Magazin..)

and ALL before I go on vacation to Montana in a few days...!!

Anyways...here's how it went...

he said it's no problem to send them $30 cash for a copy of Quick 2.1
(the latest version) plus it's manual (in German.. :( )...
I can also buy some of their QUICK Magazins... They are disks w/
programming examples including long texts for explanations. (they used
the example that QUICKmag 11 & 12 introduce the possibility for
multitasking on the 8-bits...)

They're ALSO offering me the RIGHTS TO QUICK!!! (whew! big deal, eh!?)
as well as possibly some other software... and from there I can reproduce
and distribute it as much as needed for me own profit. (course I'll
never have enuf $$$ to buy the rights!! :))..

He (Harald Schonfeld) explained that QUICK is very fast and that the
runtime pkg is linked so the programs are "stand alone." He said it's
best described as a mixture of C, Action!, BASIC, and Assembler.

He also said 4 professional games were published which were written in
QUICK (Glaggs, Rubberball, Minesweeper...) They also have a characterset
editor that uses the joystick, ST-mouse, or Atari touchtablet.. as well
as a diskmonitor... it provides routines for playing digitized music,
player movement, using of ST-mouse, copying and moving hires-graphics,
etc.etc. and can even use DLIs & VBIs automatically.

He also told me a little about SAM: includes a text editor, mono- and
color-graphics editor, characterset editor, a DOS shell, a spreadsheet &
more...all using the joystick or ST-mouse, windows, pull down menus, and
80 columns per line.

Anyways.. I'm not sure of the legalities of me purchasing the
rights to and selling any of their software.. Dean Garraghty pointed out
to me something about me needing to be 18. (that'll happen in about 9
months! :( ). I'm not sure PPP would want to wait that long, but I must
admit it is tempting.... of course I'd need quite a bit of cash to
advertise & copy the program/manual, let ALONE buy the rights to it!..

Well...to shut myself up I'll just end this with PPP's addresses:

Harald Schoenfeld (one of the programmers)
Lerchenstrasse 2
D-W-8501 Veitsbronn
Germany
--Internet: aohybrid@cnve.rrze.uni-erlangen.dbp.de (mail w/ subject of
"Letter to HS")

--ugh! very sorry. I guess it was never added to my rolodex! this
MUST BE FIXED! I beleive at least one other here on the net knows their
address... but went on vacation! ugh! anyways.. I'll find it
SOMEWHERE and post it ASAP..

for now, just bug Harald ;)
later phbill

3179. 64-bit :)

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-04 06:57:38 UTC
From: chan@pyramid.unr.edu
Message-ID: <4258@equinox.unr.edu>
Source record: 109957

Has anyone heard much about the 64-bit game machine from ATARI?
I've heard that it would be sold for under $200.00!
That's why I've put off buying a Genesis (noticed price drops!).
Atari DID scrap their 32-bit game machine because it was AHEAD of
schedule... and decided to concentrate on the 64-bit'r...

So anyone heard any peeps?

Please reply email or post!

3180. Re: Copyright/Ownership of defunct companies

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-04 15:04:36 UTC
From: brayl@nyx.cs.du.edu
Message-ID: <1992Aug4.150436.20885@mnemosyne.cs.du.edu>
Source record: 109977

Terry,

What you say is very interesting since I know of several titles on
the ST that did revert back to the progrmmer when the company went
under.

I tried postng a coupld messages to Adam a few days ago, but Nyx had
trouble, so they never made it through. The upshot was that Adam was
perhaps confusing releaseing a program into the pd with offering it
for sale...ie, just because a program is now pd, does not mean anyone
(either the author or the company) does't have copyright on the program,
they just don't expect any mney from it now.

ALso, this would be good thing for Atari Classics to work on, eh? :)

Pattie Rayl (AIM)

$.02 The companies are not being generous by allowing the employee on the patent. It's the patent department that demands the actual person who did the work gets the credit. More of a problem is people who jump on the patent W/O having anything to do with it. An actual exchange between a chemist & a program director I heard 1st hand, "You forgot to put my name on this invention record & now it is going to be filed so you have to add me <pd>!" "When I told you about it, you told me the idea was completely with out merit. That I was trying to redefine Fick's Law an didn't know what I was doing <ch>." "Well then you admit we discussed it, therefore I should be on the patent <pd>!" Needless to say the PD became a co-inventor. I've even seen "chicks" (as opposed to women) placed on patents by male (is there a better discription for guys who let sex take priority over... well everything?) administrators in order to, let's say advance their goals. I'd bet the average patent that comes out of a corporation has between 3 & 5 people listed as inventors. This usually means two heavy weights in the corporate ladder have a reciprical "You put me on yours & I'll put you on mine" deal, one person who has brown nosed enough to deserve a scrap, & the guy who actually thought of it & did the work.

3182. Classic Atari Cartridges

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-04 18:11:14 UTC
From: chase@electron.rutgers.edu

Source record: 109980

Classic Atari Cartridges for the 400/800/XL/XE computer, v. 2.0

Well, the number of contributions to this project has slowed to
a trickle. Unless I get a lot of contributions I will make this the
"final" release, and proceed to post it only occasionally. So if you've
been holding off sending in your collection of rare cartridges, wait
no longer. The count is up to 260, which is a bit under my goal of
300 cartridges, but all in all, I am quite pleased with the list.
Thanks to everyone who contributed.

Kevin Chase <chase@physics.rutgers.edu>

On an unrelated note, I got your e-mail, but in trying to respond back to you, my mail seems to always bounce back. Also sorry about all of the SpartaDOS lists. Was having trouble on this end trying to send them out because the lists were so long. So the list I broke into 7 parts is the correct one, except for a few .DOC files that didn't make it. Once again, the list was too long, but only about 12 doc files didn't make it.

Darn! No address? (my phone bill is quite happy where it is at the
moment! :)).

Why does he sell the stuff for so little? I'm sure there're people who'd
pay quite a bit more for software. (hell! I spent $50 on AW+!)

Hell! Just get a BEST Electronics catalog and you'll see pretty much
EVERYTHING Atari ever made listed!!! :) From chips to software to parts
to printer ribbons to De Re Atari to the 1450xld and 1090!!

When I opened it up I almost cried!
:)

3189. In case anyone cares.

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-04 21:51:44 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <X95ZoB9w164w@cyberden.uucp>
Source record: 109986

Just a note... I'll be gone for a little over 1 week as of tomorrow.
(don't cry! I'll be back)

I'm going up to Montana and hopefully when I get back I'll be a bit refreshed from being away from my little 1200xl and hopefully quickly finish & test my APAC Object editor (God I'm into APAC, aren't I!? :)). I'm almost seriously thinking of writing a program in BASIC that will call here every day and download all of my mail and the c.s.a.8 group (because it has a limit of 50 messages. Anything over that and they get delete.) I don't think I want to trust my 1200xl to being powered up 9 days straight. Since all of my hardware's in one place it'll probably burn the house down! I still might do it anyways! :)

Well... caui for now. And oh, btw: how do you folks feel about a "Terminator 2" game? I'm seriously thinking about THAT, too. (it would be a game in which you can't win unless you beat each "scene" from the movie. There's now way to end it all quickly at the beginning. I'd even start with the "beat up the bikers" scene, just like the movie! :) (and you know me.. I'll try to fill it with as much digitized wastes of space as I can! :))

Any comments leave as mail...if it's posted I wont get it!!
Hasta la vista, baby!

"Be seeing you!"

3190. Atari User Group Meeting - Wed Aug 12/92

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-04 22:02:25 UTC
From: daroloso@math.uwaterloo.ca
Message-ID: <BsHBw1.6tI@math.uwaterloo.ca>
Source record: 109987
Cross-posted to: uw.sys.atari,comp.sys.atari.st,comp.sys.atari.8bit,ont.micro,kw.micro

In August, the Kitchener-Waterloo Eight Sixteen Thirty-two (KWEST)
Atari user group will have a very informal meeting.

Our 16-bit library currently has over 400 disks of public domain
and shareware software.

We will also give attendees the August issue of AtariUser.

The group welcomes new members and visitors with
8-bits, 16-bits, or those just curious.

Meetings held at the University of Waterloo in the
Math & Computer Building.

Room opens at 7:00 pm. Meeting starts at 7:30 pm.

Wednesday, August 12, 1992
DCS Course Room, Room 2009 (2nd floor)

Call 725-2068 for more information.

Hope to see you there,
Dani Roloson

3191. Re: Old software

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-05 02:26:06 UTC
From: hill@spot.Colorado.EDU
Message-ID: <1992Aug5.022606.9963@ucsu.Colorado.EDU>
Source record: 109988

In article <1992Aug04.004804.17895@microsoft.com> darekm@microsoft.com (Darek Mihocka) writes:
>Because when all you hard code 8-bit pirates grow up and become hard code
>Mac or PC pirates, it will be my business to make sure you get prosecuted.
>Actually, I'm sure by posting pro-piracy messages and admitting to the
>fact that you're engaged in piracy of 8-bit software, you're not only
>pissing off the FEW ATARI DEALERS that are still sticking around to support
>losers like yourself, but it's probably enough to get you kicked off the net.
>Personally I have no interest in doing that since pirating video games
>is probably less destructive to society than letting you think up others
>ways to waste away your free time.

You are so far off base I can't even believe a single person could be so stupid! I would previously have thought your level of idiocy and incompetence would have to be shared by ten people.

Listen carefully. I'm going to say this in the simplest way so that even you and your 43 IQ can understand it.

1) What do you mean by "hard code pirate"? Any real programmer knows that "hard code" refers to explicitly coding a variable by value instead of by reference; however, that doesn't fit into your context above.

2) (IMHO) Only a complete idiot (just use yourself as a reference) would think that a PC or Mac is something to "grow up" into. Cretin. I want nothing whatsoever to do with wimpy computers like those - the Sun and Silicon Graphics workstations I use at work are real computers, not the toys you mention. So don't worry, as long as your puny mind is stuck at that level of obsolete crap, you'll never see me in the pitiful market you play around in.

3) Also don't worry, I wouldn't touch any piece of software you OR MicrobrainSoft had anything to do with, if my life depended on it.

4) I didn't post a pro-piracy message; I posted an anti-Darek-Mihocka-the-moron message. Can't you tell the difference?

5) I didn't admit to pirating 8-bit software. You seem to assume that, just because I don't like you, anything I post is a confession of piracy. Wrong. As a matter of fact I am buying software (indeed, as you say later, what a concept!).

6) I am a professional programmer, no less than you are. So you can go ahead and get of your high horse about "anything you do on a computer must be copying video games".

>I'm actually surprised by your posting in particular. Your rather lengthy
>signature would indicate that you're some sort of a Jesus freak with
>morals that would forbid you from stealing software. But it just goes to
>prove that Atari 8-bit users, regardless religious preference, are still
>the same. Reminds me of user group days in Toronto about 10 years ago.
>At 8pm it's the "we don't condone piracy" user group meeting. At 11pm it's
>the all night Archiver chipfest at the president's house.

7) Not that I claim to be a "Jesus freak", but what's wrong with them?
For that matter, what's wrong with having morals? You oughta try it some
time. And just because you couldn't handle living my "religious
preference" to save your life gives you no right to attack it.

8) Again, the bit about "stealing software" is based on some stupid
preconceived notion of yours, and has nothing whatsoever to do with
either reality or the post of mine which you were responding to. Get
a grip of the real world.

9) I take no responsibility for Toronto or anywhere else in Canada, as
I have never been there. Why don't you get a clue? If you're going to
persist in your personal attacks on me, you'd better have some real facts
to go on; otherwise I can promise you I'll rip you to shreds every time,
just like this time. Be forewarned.

>Perhaps one of you belly aching 8-bitters should do something other than
>whine about the lack of support for your machines. Why don't you try
>opening up an Atair dealership and try to sell some of the software that
>you currently pirate. And I don't mean sell pirated copies, I mean sell
>legitimate 8-bit software. There are still dealers that still do that
>you know. I know people that still actually call them and order software
>from them. Ooooh, what a concept. What you'll probaby find out is that
>your fellow members of comp.sys.atari.8bit will soon put you out of business,
>and then you'll know why Atari doesn't give a shit about vermon like you
>and why all the developers have left.

10) When's the last time you heard me "whine about the lack of support"?
Or anybody else here on c.s.a.8, for that matter? The only whining I've
seen here since I joined has been from you.

11) Atair? What's that? Did you mean Altair? I arrived on the computing
scene a little late for the Altair.

12) I don't really need to remind you of the error of your assumption
that I "currently pirate" software, do I? I'm actually one of those people
who "still actually call them and order software". Ooooh, what a concept.

>Ok, I think that satisfies your criteria of posting a potential solution
>to the problem. No doubt you will dip into your long list of adjectives
>and shoot down my idea as crap. Ok, then, sit back, and wait for someone
>else to open up that Atari dealership and then promptly proceed to put
>him out of business, and then sit there and wonder why things aren't getting
>better.

13) Au contraire. As your stupid excuse for a "potential solution" was predicated on flawed assumptions, you missed the boat entirely. (Thanks for the comment about my vocabulary, though - somebody's gotta have one to counter the posters who don't.)

14) As I would order software from somebody who would open up a business, I fail to see how that would put them out of business. Oh, but I've been over that before, haven't I?

>What's sad is that you spend so much energy whining about the problem instead
>of using that energy to if not fix the problem, then take advantage of the
>problem and benefit from it. Yes, starting a pirating operation is one way
>to benefit at the expense of your morals, but there are other ways.

15) Again, I don't see where you got the idea that *I* "spend so much energy whining about the problem" - I've never complained about lack of software. The only thing I've complained about on this group is the last three posts from you.

>- Darek

I'm willing to concede the remote possibility that if you really applied yourself, you might be able to make an actual positive contribution to this group. However, if you're unwilling or unable to do so, then please go away and attack somebody who deserves it. Quite frankly, I don't.

To the Alchemist & everybody else, sorry about the bandwidth. But it had to be said.

3192. Hardware and SoftWare for Sale!!!!

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-05 08:34:44 UTC
From: lenn@mentor.cc.purdue.edu
Message-ID: <56027@mentor.cc.purdue.edu>
Source record: 109991

I will reduce prices listed for package deals!!
I am flexible on prices.

I have the following hardware for Sale:
Atari 65XE Brand New!!! - $60

Books: Computes Atari Graphics $6
Computes Second and Third Books of Atari $5 each
Analog Compendium $5 (lots of type in programs)
Creative Atari $5

I have the following program disks for sale:

Kampffgruppe: $13

Alternate Reality: Dungeon - $12

Music Const. Set - $8.00

Pinball Const. Set - $8.00

Summer Games - $5.00

Zaxxon - $5.00 (800 only, FIX-XL, translator don't
work!!!!!!!) (no docs)

Suspended - $3.00 (Original, lost docs)

Mail Order Monsters - $7.00

Super Huey - $7.00

Page Designer -$8.00

Dropzone - $2.00

Deep Blue C w/mathlib - $12.00

All items have docs unless otherwise mentioned.

Buyer pays shipping on all items.

> \--/

Yes, Darek, you have a few good points (hidden away in all of your childish rantings). But I don't like some of your assumptions:
1) Not ALL 8-bit owners are piraters. Some of us (no, I'll bet most of us) still support the 8-bit publishers and distributors. Anyone who is crazy enough to still activly use an Atari 8-bit is probably doing it out of love. I know I am. I have owned other, more "powerful" computers and always seem to come back to my 8-bit. It's insane to think that people are going to invest $200+ into a "dead" system. Those people have packed up and moved over to IBM/Mac platforms long ago. There they can steal faster/more powerful programs that they know are going to be supported.
2) All IBM/Mac pirates are ex-Atari users. Everyone else are angels.
Xome on, I know ONE person in the IBM world who purchaces more than 10% of their copyrighted software. Am I saying that this validates 8-bit pirating. Of course not. pirating is wrong, but it is stupid to assume that we are somehow worse that everyone else. What does make it SEEM worse is the fact that the 8-bit user base is tiny. If only 40% of a piece of software floating around the IBM world was legitamatly bought, sure the publishers are going are going to be losing potential dollars, but they will (generally) make enough to cover R&D, packaging, etc and still make a profit. If the same happened in the 8-bit world, the publisher would be looking at about enough money to buy a nice dinner..

Unfortunately, it seems like you are going to hold a grudge against the whole atari community no matter what is done. So my advice to you is leave the Atari Community alltogether; you've made your statement, now let us "self destruct" in peace.

Thank you,

The 1029 was released in Europe. If I'm not mistaken, it was the best selling
printer of the XL line. Could do graphics too (try that with a 1025).

]
]Darn! No address? (my phone bill is quite happy where it is at the
]moment! :)).
]
]Why does he sell the stuff for so little? I'm sure there're people who'd
]pay quite a bit more for software. (hell! I spent $50 on AW+!)
]

I thought I included in the original posting (extracted above) that Floyd sold the business to Starbase: Atari and the new owner wanted none of the 8-bit stuff. The result is that Floyd just wants all the remaining stock OUT of his H&R Block office and is selling at ridiculous prices to get rid of it. User group members from San Antonio got first shot at it before it was opened to the public because we'd supported him through the years, but now he's selling to all comers.

As for the address, I've got it at home, but keep forgetting to bring it in here to post. If you are really interested, though, you'd best take the phone bill hit, because things are selling out rapidly and not (obviously) being replaced. If you deal by mail, by the time you get your order in the item is likely to be long gone. I expect him to be down to the dregs by September.

I'm off to Galveston this afternoon, so I'm unlikely to remember the address for posting for several days (at the least). If senility doesn't totally overrun me when I get back, I'll try to think to broadcast here by at least early next week.

3196. Atari 800xl system for sale (again)

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-05 18:34:23 UTC
From: jaked@well.sf.ca.us
Message-ID: <BsIwxB.5zr@well.sf.ca.us>
Source record: 109997
Cross-posted to: ba.market.computers,comp.sys.atari.8bit

I received little response on this before, perhaps because the price was too high. I have a system that I would like to sell:

800xl computer
Two 1050 drives
Citizen 120d printer
Sony 13" color TV

Microprint serial bus to Centronics interface
Epyx joystick

Lots of books, including De Re Atari, Compute!'s Mapping the Atari, many other Compute! books
Lots of software, including AtariWriter+, Xlent Typesetter, the Pawn, Moviemaker

Please make me an offer. I would prefer to sell the system complete, but I'm flexible (especially, if you don't want the TV that's cool by me).

3197. The 8bit software market (was Re: Old software)

... lots more ranting and raving on both sides deleted ...

Please, please! This doesn't help.

First of all, Darek is not unintelligent. He's quite a bright programmer, who has done some quite clever coding on the 8bit, ST and PC platforms for some years now. He also tends to be a bit outspoken.

His frustration with the 8 bit market is real. It seems to be quite hard to make ends meet selling software for the 8 bit Atari's. Darek attributes this to widespread piracy.

In my experience, piracy was quite widespread on the 8bit platform, but no worse than on other platforms (eg. Commodore 64, IBM PC). However, because the market for the 8bit is so much smaller than that for the 64 or PC, there are many fewer software-purchasing users in that market to sell software to. Hence the 64 or PC software market can sustain itself, despite piracy, on the purchases of legitimate users, while the Atari 8bit market, being much smaller, cannot. In that sense, therefore, piracy hurts the Atari market more, because its existence shrinks the pool of legitimate purchasers to uneconomic levels.

Note, however, that it is not clear how many software pirates would actually buy the programs they copy, if they did not or could not pirate. If all pirates suddenly reformed, it is not clear whether or not the increase in the number of software purchases would be sufficient to make the 8bit software market viable. I think Darek's claim that most or all 8bit owners are pirates is probably excessive. However, the discovery that many 8bit owners who publicly disavow piracy are secret pirates themselves is likely to make anybody cynical about this, especially a software developer who at one time may have had high hopes of obtaining financial compensation for his programming efforts.

Best regards,

John

Come on guys. Please grow up and quit cussing at each other on the internet.
If you feel like you must scream at someone electronically, please do so in
e-mail, because I'm personally (as I'm sure alot of others are), sick
of hearing you two attack each other personally.

Now while I'm posting, let me say something about both of your comments

A) darekm: You're making alot of accusations about the atari 8-bit
community without any evidence whatsoever. I feel personally insulted.
In fact, let me just say that I own a i486/33 and have PAID FOR all the
software I've ever bought from Microsoft. Even when I've had the
oppurtunity to pirate it.

B) hill: Although some of what you said was neccassary. I felt it was
totally unneeded to make fun of darek's spelling, insult him personally
to the world, and generally use profanity in every other sentence.

Now grow up guys! Leave the attacks of the net.

Elvis works for cable!

Actually... let's hear how many cable companies use 8-bit for their boring rolling text channel (our cable company uses some specific system, but when that broke down, they got ahold of a souped-up 800...never used it tho :(...) Anyways... how many of you know or can tell that your cable company uses an 8-bit?

As to hooking a Lynx cart to an 8-bit...

I suPPOSE it could be done, but what do I know!? :)

If you hooked it & some of the special Lynx chips up to the PBI port you could maybe do it. Gotta remember that systems, no matter what CPU they have, still have other "specialized" chips. (in the Lynx/classics case...GOOD ones ;))..

AnYways...if you think you can do it... do it! (never did like games on tiny screens :))...

The Z*NET Global News Gateway "status.gen.nz") also including discussion on
all aspects of the following

- Atari Explorer On-line
- Z*NET PC
- Z*NET Fido echo's (Zone 3)
- Z*NET FNET

Topics would include those current discussed in the Z*NET FNET echo, GEnie,
Delphi, Compuserve, Bix, Fido and comp.sys.atari.st which cover Z*NET Topics

- Letters to the Editor
- Current issue feedback
- Columnist's reply
- Letters to the Z*NET Global Crew
- Atari Explorer On-line
- Z*NET PC
- Z*NET FNET echo's
- Z*NET Fido echo's (zone 3)
- Z*NET Pacific
- Z*NET Europe
- Z*NET USA
- Z*NET Canada

Topics will also include an open forum to discuss topics of interest with the
Director of Communications at Atari Inc, USA and will be open to all Atari
based computers ie 8bit Series, ST Series, PC Series etc. Feedback will be
gatewayed back to fido net and FNET thus allowing a great interaction of users
across three networks.

Discussion of this proposal should be posted to news.groups. As per the Guidelines, discussion that occurs there is the only discussion that counts. If your site does not carry news.groups, and you are interested in this discussion, get your administrator to carry the group.

Are you SURE about the 50/60hz thing not being important? It seems to be. I have the European version of TurboBASIC XL's runtime package and compiler, and when I run my clock program in TBXL it works fine, but when compiled it is exactly 50 seconds to the minute. (ie my watch says only 50, but the computer says 60...)

hmmmm

In article <1992Jul30.004350.6820@dartvax.dartmouth.edu>
crow@coos.dartmouth.edu (Preston F. Crow) writes stuff about 8-bit
owners...

Know another 8-bit Atari owner... George Lucas. The original Star Wars
used a Atari 8-bit 800 for some of the graphics. I talked with the owner
of B&C, and he told me the story about when George brought in his 800 to
be fixed, and how he wanted that EXACT machine fixed, not a swap, and did
not care how much it cost.

FYI

You said:
> [..] and no APAC isn't the answer for realtime games [..]

WHADDAYA MEAN!? I'm working on a rather nice (but VERY undeveloped,
quickly made, flickery-because-i-made-it-that-way) APAC mode Asteroids
game....!!!

It's in TBXL... it looks ok. Just imagine it in Action! or Assembler or
Quick...!!!

3207. Trak At-D10

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-05 23:08:40 UTC
From: bbs@neb
Message-ID: <1992Aug5.230840.4280@neb>
Source record: 110009

From: James King@Neb aka Kamaro Kid
.
I just picked up a Trak At-D0 disk drive setup w/slave drive
attached. The slave drive appears to be a standard full sized IBM style
drive mech. Is it possible to replace it with a 360k mech (it is current
single sided double density 180k).. If so, how do I go about
accomplishing this? The cable is a 25 pin (I think) ribbon cable - a
standard IBM drive requires the card edge style connectors..

(checking the net for ONE last time ;))...

I'll take it you can swap between BBK & RAMbrant files? Say, make a nice pic in BBK & then port it over to RAMBrant and do the DLI stuff (didnt know there was a program that supported that! ... must be sorta strange to mess w/ at first, i bet...)

3210. UPDATE: Atari stuff for sale

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-06 01:22:47 UTC
From: dave@bradley.bradley.edu
Message-ID: <1992Aug6.012247.17281@bradley.bradley.edu>
Source record: 110007
Cross-posted to: misc.forsale,misc.forsale.computers,comp.sys.atari.8bit

```
Lots of stuff has been flying out of here....here's an updated list of
items available for sale. All reasonable offers will be considered.
Buyer pays shipping.

Hardware
--------

1030 300 baud modem
1020 plotter (with 2 sets of pens, Joystick Sketcher cassette software,
and manual)
1050 disk drive (inoperative but I don't know how severely)
1010 cassette drive
2600 remote control joysticks
touch tablet (with Atari Artist cartridge software)

Software cartridges (with box and manual unless otherwise noted)
-------------------
Choplifter by Broderbund
Submarine Commander by Thorn-EMI
Atlantis by Imagic
Centipede by Atari (no box or manual)
Star Trek by Sega
Missile Command by Atari (no box or manual)
Demon Attack by Imagic (no box or manual)

Software disks (with box and manual)
--------------
Zork I by Infocom
Ghostbusters by Activision
Pinball Construction Set by Electronic Arts
Music Construction Set by Electronic Arts
Temple of Apshai by Epyx
Microleague Baseball by MLSA
MLB General Manager's Disk by MLSA
Computer Quarterback by SSI
Computer Baseball by SSI
Lode Runner by Broderbund
Hitchhiker's Guide to the Galaxy by Infocom
Sargon II Chess by Hayden
Summer Games by Epyx

Software cassettes (with box and manual)
------------------
Eastern Front 1941 by Chris Crawford (original APX issue)
Statistics I by Atari
```

Compute 4 / Reversi by Thorn-EMI
Slinky by Cosmi

Books

Compute's First Book of Atari
Compute's Second Book of Atari
Inside Atari BASIC
Computer Software Protection and Code Breaking by L. Gardner

plus....30-40 'blank' disks. =-) Lots of software, much of it out of print.

--------============>>>> A T A R I C L A S S I C S <<<<============-------

----------=====>> A New Magazine for the 8-Bit Enthusiast !!! <<==========-----

Greetings Fellow Atari 8-Bit Users!

My name is Ben Poehland, and I'm pleased to announce that I shall be serving as Managing Editor of Atari Classics (AC), a new magazine exclusively devoted to the Atari 8bit user. If you are among the thousands who have bemoaned the recent loss of nationally distributed magazines that once supported your beloved 8-bit, I'm here to add a long-overdue ray of hope to your 8bit future!

The philosophical orientation of AC- incorporated in its Manifest- is to be a magazine "of, by , and for the Atari 8bit user". Unlike previous 8bit periodicals, the content of AC will directly reflect the expressed desires of the user community, especially as recorded during the Mail-In Campaign conducted January 15- May 2, 1992. The magazine will be staffed by members of the user community, and its content will be drawn entirely from the user community.

Unicorn Publications, already well-known for its outstanding Atari Interface Magazine (which covers both the ST and 8bit markets), has agreed to provide publishing services for AC. AC and AIM will be essentially independent publications, and the addition of AC to Unicorn's stable of products will not affect AIM's present subscribers. One of the many unique arrangements concerning AC is that its actual day-to-day operation will be largely in the hands of the user community rather than the publisher. Whatever "flavor" we decide to give it will be entirely our own.

Atari Classics represents a unique experiment in the history of the Home Computer Revolution that began in the mid '70s. With Atari Corp.'s announcement of discontined support for all 8bit products in January 1992, an entire class of machines with a global installed user base numbering in the hundreds of thousands was abandoned along with the community of users who still use them. But for the first time, a rejected user community has marshalled its resources and declared its right to exist independent of Corporate America. We respond to Atari's challenge in a way that would make our forefathers proud: by rolling up our shirtsleeves and doing the job ourselves!

This will be YOUR magazine. AC will succeed- or fail- on the number of subscription orders it receives. Although seed money to print the Premier Issue has been provided, the magazine will need 500 paid subscriptions to succeed. A limited production run of 800 issues is scheduled for October or November 1992. Most of these will be distributed- FREE OF CHARGE- to the roughly 600 people who sent in commitment cards during the Mail Campaign.

That's right: if you sent in your card,

YOU WILL GET TO READ THE FIRST ISSUE FOR FREE BEFORE YOU DECIDE TO BUY.

(When was the last time you saw a deal like that??)

Of course, there were some folks who got missed in the Mail Campaign.
So we ordered up those few extra copies which will also be distributed for
free. First come, first serve, please don't block the stampede! You can write
to:
Atari Classics
179 Sproul Rd./Rt. 352
Frazer, PA 19355 USA
ATTN: B. Poehland, Managing Editor

to have your name added to the list for a free copy of the Premier Issue.
(No guarantees, and be sure to include your postal mailing address!)
If you sent in your Campaign card it will NOT be necessary to request your
free trial issue, as your name is ALREADY among the LUCKY 600!

The basic subscription fee is $25/year in the USA, with higher fees for
Canadian and other non-US subscriptions. Full details on subscriptions will
appear in the Premier Issue and in future announcements. Beginning in 1993
the magazine will be distributed bimonthly (6 issues/year).

A software disk bearing programs published in AC plus selected offerings
from the Public Domain, will be availble separately for $9/year in the USA.
The disk will be distributed independently but will be timed to appear with
every other issue of the magazine (3 disks/year). Full details on disk
subscriptions will also appear in the Premier Issue and in future
announcements.

The content of Atari Classics will initially lean toward user
applications, hardware tutorials and modifications, programming, and soft-
ware reviews. We plan to agressively recruit paid commercial advertising
from scarce 8bit vendors, and to publish periodic lists of current 8bit
supply sources.

Best of all, PAID subscribers will be able to place FREE ads in AC
to buy, sell or trade their personal 8bit treasures! (But of course, yah
gotta SUBSCRIBE first!)

And, we'll have a whole bunch of other stuff, contributed by some of
the most talented writers and hackers in the Atari 8-bit world, authors
whose names you've seen gracing the pages of ANTIC, ANALOG, Current Notes,
and Atari Interface Magazine. (You'll notice not very many details there-
we wanna pique your imagination!)

As of this announcement (August 5, 1992) only a few of the Staff
positions at AC have been filled. We are starting completely from scratch,
but anticipate most of the administrative machinery for operating the
magazine will be in place by the end of August and production begun on our
Premier Issue. (We'll need a month to get used to working with each other
in an environment of near-total chaos!)

And when you see that first issue appear in your mailbox this autumn,

IT WILL BE YOUR TURN TO DECIDE THE FUTURE OF YOUR MACHINE !!

Please post/copy/distribute this announcement freely, and stay tuned for future announcements !!!

I tend to agree with you. I think that if we did stop whining about the support, and support the Shareware and PD and if any a commercial software company...I think that Users Groups ought to ban together, and get a library for the 8-bit like the Amiga's Fred Fish. With the Amiga, they can get good software titles from the User Group, and not pay $2.50 per disk....

I think that if we unite into one big "clump" I think we could revive that 8-bit, but if we sit around and wait for the day(for example) ICD to write SDX 5.0, then we will be waiting for a long time. Who would like to see an action like this take place???? I for one would like to see it to happen.

>-mjl

The problem is that cleveland.freenet.edu is not the name of a particular computer on the Internet, it is a collective reference to all the Free-Net machines. I don't quite follow what's going on in your transcript above, but for some reason you're testing whether cleveland.freenet.edu is a machine you can telnet to, and failing the send since it isn't. If you can suppress that testing or have it send anyway, your message will get through. If not, you will be able to send to aa596@po.cwru.edu with no hassles.

3218. 800XL as a server

Newsgroup: comp.sys.atari.8bit
Date: 1992-08-06 20:16:56 UTC
From: van@buengf.bu.edu
Message-ID: <93053@bu.edu>
Source record: 110013

Hi,

I have an Atari XE, 800XL, 400, 1050 disk drive and 1020 printer. For those who have 1050 and 1020, I'm sure that you know how slow these devices are. Also since my 1050 starts to loose some of my files, I have to back up every files every single time. What I'm thinking is maybe I can use the 800XL as a file and a printer server. Instead of sending the file directly to the disk I could send it to the 800 (either throught a NULL modem or throught the joystick ports). Since the 800 would store the file in its RAM first, it would be much faster. When the transmission is done, the 800 would save or print out the file. I then can go and continue my work while the 800 works with the slow disk or printer.

There are still more problems which I have not figured out the way to get around yet. I try to make the new 'server' easy to use with the least modification as possible. For example: I don't have to add a new device (and the handler), I still can type SAVE#D:filename (I'm using MAC65) and it would work. The only way to do that is to make the server (800XL) to act as a disk or printer so that the XE (which is the computer I'm working on) does not know the different. I can't connect the XE and XL by using the SIO though. Maybe I can go from the XE SIO to the XL joystick ports and from the XL SIO to the disk and printer. I have to have software for the XL though.
